SmartConnect 21 Info and Help

The SmartConnect 21 user manual is intended to be used as a reference for any window or field a user can interact with in the product. The manual is structured in a way that matches the menus and layout of the current SmartConnect 21 interface.

For installation and setup requirements, reference the SmartConnect 21 Install and Upgrade Manual.

System – Setup

SmartConnect Setup – Settings

The Settings tab has options that will apply across the entire application.

Default Date Format	Set the UI date format.
Default Time Format	Set the UI time format.
Time Zone	Select the time zone.
Error File Path	Set the path where errors will be saved.
Process Errors File Path	Set the path where process errors will be saved.
Script Language	Set the default script language. This can be changed per integration. Once an integration has scripts setup, changing this setting will not convert any scripts.
SmartConnect Temporary File Location	Select a directory where SmartConnect will have access for temporary files. Required to import integrations.
Customer Feedback	Check to disable sending feedback to eOne Solutions.

SmartConnect Setup – E-mail Settings

SMTP Server	Server address for the email server.
Port	Set which port is used for email server.

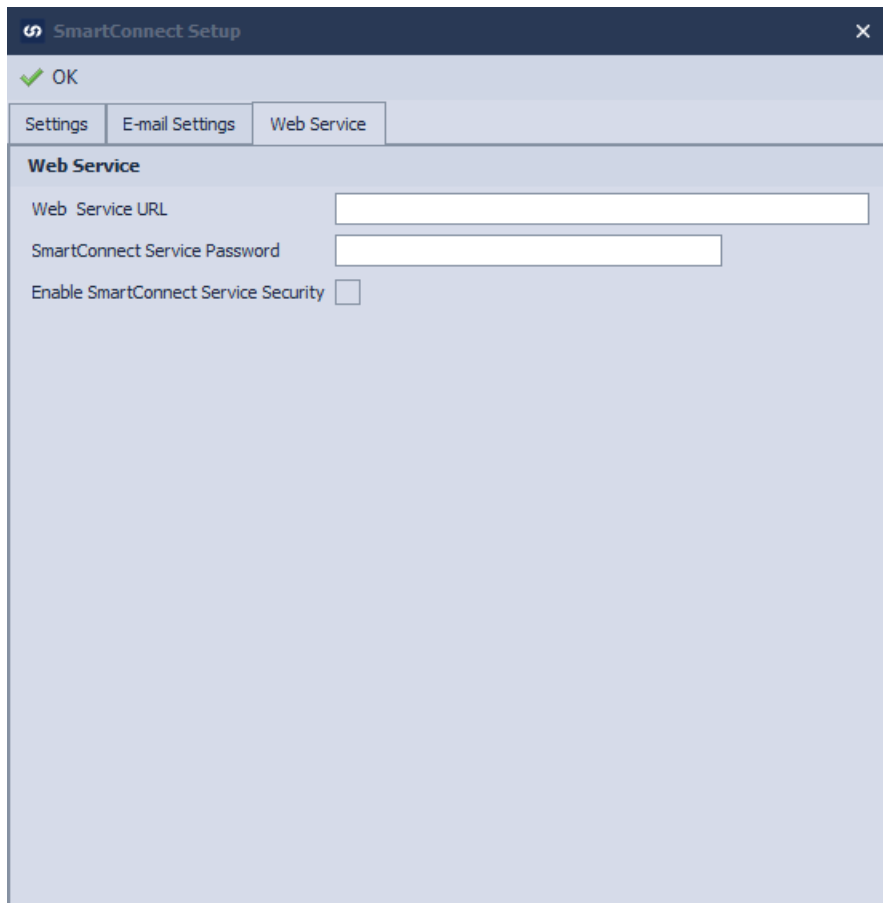

Use Ssl	Check box if SSL is required for the email server.
Username	Username for the desired email account.
Password	Password for the email account.
Domain	Domain name for the email account. This can be left blank if not used.
Test Email	Button used to test email settings. Enter a from and to address to test the above settings are correct.

The image shows a software window titled "SmartConnect Setup" with a close button (X) in the top right corner. Below the title bar is a status bar with a green checkmark and the text "OK". Underneath is a tabbed interface with three tabs: "Settings", "E-mail Settings", and "Web Service". The "E-mail Settings" tab is currently selected. The settings area contains the following fields and controls:

- SMTP Server**: A text input field.
- Port**: A spinner control showing the value "25".
- Use Ssl**: An unchecked checkbox.
- Username**: A text input field.
- Password**: A text input field.
- Domain**: A text input field.
- Test Email**: A button located to the right of the Domain field.

SmartConnect Setup – Web Service

Web Service URL	Enter the SmartConnect web service URL.
SmartConnect Service Password	Set the password for the SmartConnect service user. Users accessing the web service will use their own email/password combination.
Enable SmartConnect Service Security	Check this box to enable security options. Security is then available on the main Setup tab under Web Security.
	See Security – Web Security for more information.

The image shows a screenshot of the 'SmartConnect Setup' application window. The title bar is dark blue with a white 'X' icon. Below the title bar is a light blue header area with a green checkmark and the text 'OK'. The main content area has a light blue background and contains three tabs: 'Settings', 'E-mail Settings', and 'Web Service'. The 'Web Service' tab is selected. Under the 'Web Service' tab, there are three fields: 'Web Service URL' with a text input box, 'SmartConnect Service Password' with a text input box, and 'Enable SmartConnect Service Security' with an unchecked checkbox.

System – Running Servers

The Active SmartConnect Servers window will list any servers that have a component of SmartConnect installed and running on them. This includes the user interface, the windows service, and the API/web service.

Active SmartConnect Servers

✕

OK

Running Servers

	Server Name	Server Type	Current Version
→	HANSEL-LAPTOP	User Interface	21.1.0.447

Globals – Global Variables

User global variables can be created using this window. Default values can be set for any user global variable as well.

Global variables will retain any value stored in them for the duration of an integration execution. If a default value is set, the global variable will have that value stored in it when the integration begins processing. If no default value is set, the global variable will begin as an empty string.

Once the integration has finished processing, the global variable will revert to its default value or empty string if no default value has been set.

Manage User Global Variables

Save Cancel

New Global Variable

Variable Name Add

Global Variable Defaults

Variable Name	Default Value
→ GBL_EONEACCOUNTS	
GBL_MANUAL	1
GBL_SCHEDULED	0
GBL_SHIPSTATIONCREATEDATE	
GBL_SHIPSTATIONORDERDATE	
GBL_SHIPSTATIONORDERSTATUS	
GlobalAdministratorAddress	
GlobalBCCAddress	
GlobalCCAddress	
GlobalFileName	
GlobalFilePath	

Globals – Secure Global Variables

Secure global variables can be created using this window. Default values can be set for any secure global variable as well. The main differences between secure global variables and user global variables are that secure global variables have their values masked in the interface and encrypted in the SmartConnect database.

Secure global variables will retain any value stored in them for the duration of an integration execution. If a default value is set, the global variable will have that value stored in it when the integration begins processing. If no default value is set, the global variable will begin as an empty string.

Once the integration has finished processing, the global variable will revert to its default value or empty string if no default value has been set.

Variable Name	Default Value
GBL_USERNAME	*****
→ GBL_USERPW	*****

Globals – Global Rolling Columns

Global rolling columns can be setup to allow integrations to generate a custom next document number for each record. Global rolling columns will increment by 1 for each record that is processed and can be used across multiple integrations safely.

Name	The ID of the global rolling column.
Description	The description used to help identify the global rolling column.
Next Number	The incrementing value to be initially used by the global rolling column. This will also display the current value of the next number.

It is important to leave room for the number to “roll over” as it increments. The total length of the value will never change so 0’s have to be left within the number to allow it to increment. For example, the value IMPORT0099 will generate the next number of IMPORT0100 the next time a record is processed.

Global Rolling Columns

	SALESNUMBER	Sales Transaction Next Number	SCSOP0000012

Delete

Globals – Script Namespaces

The Default Script Namespaces window allows additional namespaces and DLL's to be loaded into SmartConnect for using in custom scripting windows.

Load From GAC	If the DLL is registered in the Windows GAC, then this option should be used to complete the setup.
Load From File	If the DLL is located elsewhere in a directory, this option should be used to complete the setup.
Assembly Name	Only visible if “Load from GAC” is selected. The DLL name should be entered here.
Assembly	Only visible if “Load from File” is selected. The full path to the DLL should be entered here.
Namespace(s)	The namespaces defined in the DLL loaded from the prior steps. One or more can be selected to load into the stored namespaces in SmartConnect.
Add Selected	Adds the highlighted namespaces from the namespace list.
Remove Selected	Removes the selected namespaces from the Current Namespaces list. None of the default namespaces should be removed from the list.

Default Script Namespaces

System	System
System.Data	System.Data
System.Data	System.Data.SqlClient
System	System.IO

Remove Selected

Setup – Translation Tables

The Translation Table Setup window allows different tables to be setup that contain a conversion from one value to another. When used in an integration, any incoming value that matches an existing value in the “From” column will be translated to the associated value in the “To” column.

Table Name	The ID of the translation table.
Table Description	The description used to help identify the translation table.
From	The value that is expected from the source data.
To	The value that will be output from the translation table if a match is found on the associated From value.

The screenshot shows the 'Translation Table Setup' window. At the top, there are buttons for 'Save', 'Clear', 'Delete', and 'Import'. Below these, the 'Table Name' is set to 'TRXTABLE' and the 'Table Description' is 'SOP Transaction Translations'. The main section is titled 'Translation Table' and contains a table with two columns: 'From' and 'To'. The table has 6 rows of data, with the last row 'Fulfillment Orders' highlighted and a right arrow next to it.

From	To
Quote	1
Order	2
Invoice	3
Return	4
Back Order	5
→ Fulfillment Orders	6

Setup – Integration Groups

Integration groups can be created using this window. Integrations can be assigned to existing integration groups which allow for security to be set across the groups and for filtering on integration groups in the integration list dashboard.

Dynamics GP – Node Maintenance

SmartConnect breaks eConnect nodes down into different groups, with each group pertaining to a different integration area. Nodes may be amended, re-grouped, created, and added to new groups depending on user requirements.

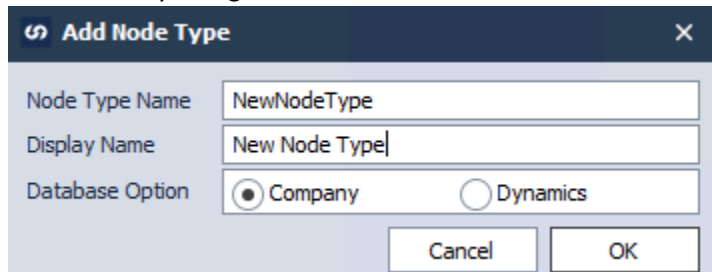

Node Groups

Node groups are used to arrange node types into functional groups. All the standard eConnect nodes have been placed into groups, and these groupings are what is used when selecting Dynamics GP destinations in SmartConnect. Users can add new groups, and re-group standard eConnect nodes.

Node Types

Node types are used to group each node group into further sub-groups. All standard eConnect nodes are automatically categorized within SmartConnect.

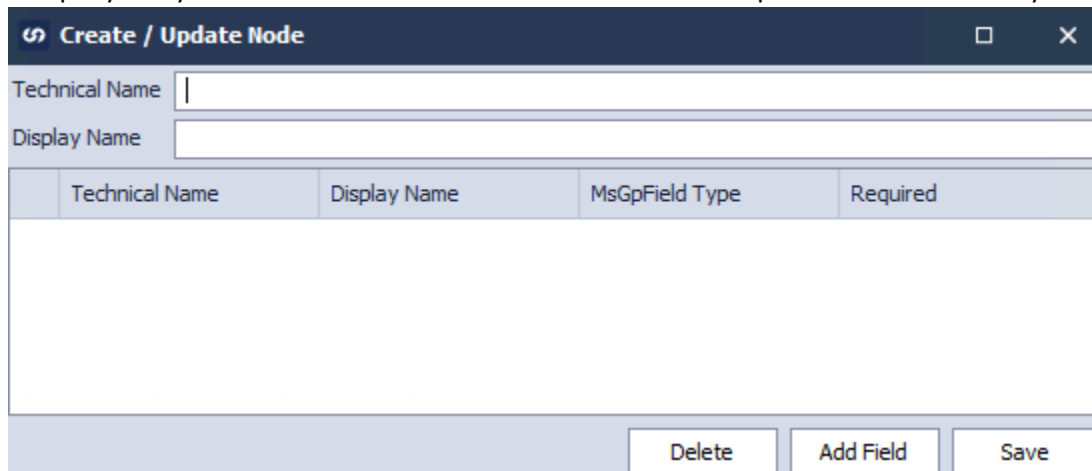

The 'Add Node Type' dialog box contains the following fields and controls:

- Node Type Name:** A text input field containing 'NewNodeType'.
- Display Name:** A text input field containing 'New Node Type'.
- Database Option:** Two radio buttons, 'Company' (selected) and 'Dynamics'.
- Buttons:** 'Cancel' and 'OK' buttons at the bottom right.

Nodes

Nodes are the objects within eConnect that are used to create / update or delete Dynamics GP transactions or reference information. Nodes may be added to allow integration with objects that eConnect does not support, or third-party products where data is stored inside the Dynamics GP company or Dynamics databases. To add a new node a stored procedure must already exist.

The 'Create / Update Node' dialog box contains the following fields and controls:

- Technical Name:** A text input field.
- Display Name:** A text input field.
- Table:** A table with 4 columns: 'Technical Name', 'Display Name', 'MsGpField Type', and 'Required'. The table body is currently empty.
- Buttons:** 'Delete', 'Add Field', and 'Save' buttons at the bottom right.

List Options

Node list options within SmartConnect allow a list of selections to be predefined for a node field. This is useful in instances where a node stored procedure required a value that would be unknown by the end user. A label known to the end user can be shown and selected with the related code supplied to the stored procedure in the background. Set a field to List and click the ellipses button to define the list

items.

Field List Maintenance			
	Description	Value	Default
→	Sales Inventory	1	<input type="checkbox"/>
	Discontinued	2	<input type="checkbox"/>
	Kit	3	<input type="checkbox"/>
	Miscellaneous Charges	4	<input type="checkbox"/>
	Services	5	<input type="checkbox"/>
	Flat fee	6	<input type="checkbox"/>

Copy and Remove Nodes

Copying a node allows users to update the same node multiple times through a single map run. Right click a node and choose Copy.

Right click a node and choose Remove Node to delete a node.

File – Logs

Integration – Integration Log

Selecting the Integration Log under File>>Logs>>Integration Log or the View Log button on the integration progress window will open the View Integration Log window in SmartConnect.

Web Service – Security Logs

All requests received by a SmartConnect WCF REST service that fail SmartConnect validation are automatically written to the SmartConnect service security log.

The following information is logged against each invalid request:

- Date - the date and time of the invalid request.
- Client IP address - the client endpoint address.
- Server IP address - address of the server that received the request.
- Rejection reason - the reason the request was rejected.
- Username - the username passed from the client.
- Serialized request - the request serialized to string.

Event Logs – Event Logs

SmartConnect errors that are logged to the windows event log, are also logged to the SmartConnect database. This means that errors that have occurred on another server or client can be viewed centrally through the SmartConnect client. Only errors that occur in SmartConnect before SmartConnect has connected to the SmartConnect database are stored in the event log on the machine on which the error occurred.

Connections

Connections – Navigation – Create

Dynamics 365 Business Central ODataV4

Description	Name given to the new Connection.
Service URL	Enter your Service URL – this will be the base URL for OData services up to the /ODataV4/ portion of the URL (ie. <a href="https://api.businesscentral.dynamics.com/v2.0/<tenant-guid-here>/Production/ODataV4/">https://api.businesscentral.dynamics.com/v2.0/<tenant-guid-here>/Production/ODataV4/). Your tenant GUID will be unique for each BC tenant/instance.
Use OAuth	<p>If checked, the connection will need to be setup using the new OAuth process. Below is the link on how to setup that process. Connecting to Dynamics 365 Business Central using an OAuth Token SmartConnect (eonesolutions.com)</p> <p>If not checked, the connection will be setup using username/password. The username can be found in Business Central under “Users”, and the password will be the Web Service Access Key for that user.</p> <p>Note: OAuth will be the only option in the future.</p>
Tenant Id	The ID of the BC Tenant being used.
	This can be located within the Service URL.
Client Id	The Client (Application) Id from the application that was registered in the Azure Portal.
Client Secret	The Client Secret from the application.
	If the secret value was not saved when registering the application, then a new secret and value will need to be created.
Verify	This will start the OAuth process and you will be directed to a Microsoft login if not already logged in. If you were still logged in, you will be asked to grant permissions. Click accept to grant the permissions. If your user does not have the proper permissions, you will need to have an admin user grant the permissions.
Get Access Token	Click to finish the validation process.
Default Company	Company that will be used by default.
Refresh Metadata	Click to refresh the metadata of the BC Tenant.
eOne Redirect URL	The URL that will need to be added to the application in azure.

Default Company: CRONUS US

Dynamics 365 Customer Engagement

Description	Name given to the new Connection.
CRM Server	Enter the server address excluding the organization name. This will vary depending on which region CRM/CE is located in – ie. crm.dynamics.com, crm4.dynamics.com, crm11.dynamics.com, etc.
Use OAuth 2.0	OAuth option will be checked automatically, and it cannot be unchecked. Below is a link on how to setup the CE OAuth process. Connecting to Dynamics 365 Customer Engagement SmartConnect (eonesolutions.com)
Use Regional Discovery	Check the option if using the main “crm” region, or the “crm9” region. Those regions have a local discovery service that simplifies the connection process. If using any other region, keep the option unchecked.
Client Id	The Client (Application) Id from the application that was registered in the Azure Portal.
Client Secret	The Client Secret from the application. If the secret value was not saved when registering the application, then a new secret and value will need to be created.
Verify	This will start the OAuth process and you will be directed to a Microsoft login if not already logged in. If you were still logged in, you will be asked to grant permissions. Click accept to grant the permissions. If your user does not have the proper permissions, you will need to have an admin user grant the permissions.
Get Access Token	Click to finish the validation process.
Organization	Organization that will be used by default. Note: If you are using the “crm” or “crm9” region with the “Use Regional Discovery” checked, then the setup is complete, and you can save and close the window. If using a different region, the steps below will need to be followed to complete the OAuth process.
Verify Organization	This will start another OAuth process for the organization selected (Microsoft requires authentication at both the discovery and tenant level now) and you will be directed to a Microsoft login if not already logged in. Permissions should already be granted from the steps above so once the page refreshes you can continue within the app.
Get Organization Token	Click to complete the authentication process.
Allow Advanced Messages	Check to allow advanced messages.
Allow meta data updates	Check to allow meta data updates.
eOne Redirect Url	The URL that will need to be added to the application in azure.

The screenshot shows the 'Dynamics 365 Customer Engagement Setup' window. At the top, there are 'Save' and 'Cancel' buttons. The 'Settings' section contains the following fields and controls:

- Description:** New Dynamics 365 CE Connection
- CRM Server:** crm.dynamics.com
- Use OAuth 2.0:** ☒
- Use Regional Discovery:** ☐ (This checkbox is unchecked in this screenshot)
- Client Id:** a8cbc1a9-7df7-4d3e-a0c6-24a529d1324c
- Client Secret:** A field filled with 20 dots, with 'Verify' and 'Get Access Token' buttons below it.
- Organization:** eOne Integrated Business Solutions (dropdown menu), with 'Verify Organization' and 'Get Organization Token' buttons below it, and a 'Refresh' button to the right.
- Allow advanced messages:** ☒
- Allow meta data updates:** ☒
- eOne Redirect Url:** https://loginsmartconnect.azurewebsites.net/oauth/genericredirect

Note: The below screenshot has “Use Regional Discovery” checked since it’s the “crm” or “crm9” region. This removes the last 2 verification steps and simplifies the connection setup.

This screenshot is identical to the one above, but with the 'Use Regional Discovery' checkbox checked. The 'Verify' and 'Get Access Token' buttons under the 'Client Secret' field, and the 'Verify Organization' and 'Get Organization Token' buttons under the 'Organization' dropdown, are no longer visible, indicating they are bypassed when 'Use Regional Discovery' is enabled.

FTP Server

Description	Name given to the new Connection.
Host Name or IP Address	Enter the Host Name or IP Address on the FTP Server.
ServerType	Either FTP, FTPS, or SFTP
Port	Enter the Port.
Use Default	If checked, the default Port will be used.
	If not checked, select the Port being used.
Keep Alive	If checked, it shouldn't let the connection close.
Data Connection Type	Options include AutoPassive, PASV, PASVEX, EPSV, AutoActive, PORT, and EPRT.
Encryption Mode	This field will only be enabled for a Server Type of FTPS.
	Options include Auto, None, Implicit, and Explicit.
User Name	Username of the login user.
Password	Password of the login user.
Key File	This field will only be enabled for a Server Type of SFTP.
	Select the key file, must be formatted as openssh or ssh.com.

Test

Description	Name given to the new Connection.
CRM Server	<p>Enter the default CRM server and port. Do not enter the http/https prefix.</p> <ol style="list-style-type: none"> 1. For Active Directory installations the server name is required. If the CRM server is not running on port 80 the port number should also be entered. 2. For Internet Facing Deployments, the server name should be prefaced with the discovery service alias (usually dev)
Authentication Type	Either Internet Facing Deployment or Active Directory.
Use Ssl to connect	Select "Use Ssl to connect" if https is required to connect to the CRM server. Internet Facing Deployments will automatically assume that SSL is to be used.
Use the following credentials	If a single user is to be used to connect SmartConnect and CRM check the "Use the following credentials" checkbox. (Note: Facing Deployment installations require definition of a single user to connect to CRM)
Domain	Enter the AD domain of the user to be used to connect to CRM.
Username	Enter the username to be used to connect to CRM. (Note: if nonstandard ports have been used for an IFD installation, the full username may be required to connect to CRM e.g. administrator@dev.eonesolutions.com)
Password	Enter the password to be used to connect to CRM.
Organization	<p>Select the Refresh button to retrieve the list of CRM organizations.</p> <p>Select the default organization.</p>
Service Url	The Service Url will populate automatically and is read only.
Metadata Url	The Metadata Url will populate automatically and is read only.
Allow advanced messages	If users are allowed to use the advanced messaging for CRM within SmartConnect, select the Allow advanced messages checkbox.
Allow meta data updates	If users are allowed to update meta data information within CRM, select the Allow meta data updates checkbox.

Generic REST Instance

Configure a REST Service instance utilizing one of the REST Service Definitions configured on the 'Maintenance' tab. If an image was defined on the REST Service Definition, the image will display in the list as shown on Option 1. If an image was not defined on the REST Service Definition, it will display with a generic image as shown on Option 2.

Generic REST Instance – Instructions

If Install instructions were defined in the REST Service Definition, they will display here.

Rest Service	Read-only name of the REST Service Definition being used.
Name	A friendly name for this Connector Instance.

Generic REST Instance Setup

Save Cancel

Settings

Rest Service: HubSpot (4)

Name: HubSpot Production

Instructions Authentication Variables

Welcome to the HubSpot REST Connector for SmartConnect.

The connector was built using v2 and v3 web services.

The official documentation for the v2 API can be found [here](#).

The official documentation for v3 API can be found [here](#).

Authentication

This connector will use OAuth 2.0 authentication as outlined [here](#).

1. Create a [developer account](#).
2. Create an [app in your developer account](#).
 1. Give the app a name and description
 2. Change to the "Auth" tab and enter the redirect URL for your region.
 1. To find your redirect URL, log into SmartConnect.com > System > API Settings
 2. Copy the OData Redirect Uri, it will look like: [app.smartconnect.com/Rest/OAuthInstanceRedirect](#)
 3. Paste this value into your HubSpot app as "Redirect URL"

Generic REST Instance – Authentication – Basic

This section is only shown if Authentication Method on the Rest Service Definition is set to 'Basic'. This method will Base64-encode the credentials and include them in an Authorization header with all requests.

User Name	System defined username.
Password	System defined password.

The screenshot shows a dialog box titled "Generic REST Instance Setup" with a close button (X) in the top right corner. Below the title bar are "Save" and "Cancel" buttons. The main area is labeled "Settings" and contains the following fields:

- Rest Service:** A text box containing "WooCommerce_1.0.0.0".
- Name:** A text box containing "WooCommerce".
- Authentication Tab:** This tab is selected, showing the "Basic Authentication" section with two fields:
 - User Name:** A text box containing the Base64-encoded string "ck_959cf354e5f73c7585cde4e526759a1f3cd505b3".
 - Password:** A text box containing a series of asterisks "*****".
- Instructions and Variables Tabs:** These tabs are visible but not selected.

Generic REST Instance – Authentication – OAuth2

This section is only shown if Authentication Method on the Rest Service Definition is set to 'OAuth2'

Client Id	System defined client id variable that can be mapped in the OAuth request.
Client Secret	System defined client secret variable that can be mapped in the OAuth request.
Scope	System defined scope variable that can be mapped in the OAuth request.
Authorize	Attempt to retrieve an access token.
Refresh Access Token	Attempt to refresh the access token.

The screenshot shows the 'Generic REST Instance Setup' dialog box. At the top, there are 'Save' and 'Cancel' buttons. Below them is a 'Settings' section with two tabs: 'Instructions' and 'Authentication'. The 'Authentication' tab is selected. Under this tab, there is a section titled 'OAuth2 Authentication'. It contains three input fields: 'Client Id' with the value 'b02c8d8c-1433-4c2b-97eb-6b859ef83990', 'Client Secret' with a masked value '*****', and 'Scope' with the value 'contacts oauth integration-sync tickets e-commerce accounting'. At the bottom right of the 'OAuth2 Authentication' section, there are two buttons: 'Authorize' and 'Refresh Access Token'.

Settings	
Rest Service	HubSpot (4)
Name	HubSpot Production
Instructions Authentication Variables	
OAuth2 Authentication	
Client Id	b02c8d8c-1433-4c2b-97eb-6b859ef83990
Client Secret	*****
Scope	contacts oauth integration-sync tickets e-commerce accounting
<div>Authorize Refresh Access Token</div>	

Generic REST Instance – Authentication – Exchange Token

This section is only shown if Authentication Method on the Rest Service Definition is set to 'Exchange Token'

User Name	System defined username variable that can be mapped in exchange request.
Password	System defined password variable that can be mapped in exchange request.
Connect	Attempt to retrieve initial access token.

The screenshot shows a window titled "Generic REST Instance Setup" with a close button (X) in the top right corner. Below the title bar are "Save" and "Cancel" buttons. The main area is labeled "Settings" and contains two tabs: "Instructions" and "Authentication". The "Authentication" tab is selected. Under the "Token Authentication" section, there are two input fields: "User Name" with the value "ethan.sorenson" and "Password" with the value "*****". A "Connect" button is located at the bottom right of the "Token Authentication" section.

Settings	
Rest Service	MediusConenctor
Name	Medius Sandbox
<div>Instructions Authentication Variables</div>	
Token Authentication	
User Name	ethan.sorenson
Password	*****
<div>Connect</div>	

Generic REST Instance – Headers

This section is only shown if connector level headers are defined in the Rest Service Definition.

Name	The name of the header as outlined in the REST API documentation.
Description	A friendly description for the header.
Value	The value to be used by the header.

The screenshot shows the 'Generic REST Instance Setup' dialog box with the 'Headers' tab selected. The 'Rest Service' field is set to 'Procore' and the 'Name' field is also 'Procore'. The 'Headers' tab is active, showing a table with one header entry: 'Procore-Company-Id' with a value of '31153'.

Settings		
Rest Service: Procore		
Name: Procore		
Instructions	Authentication	Headers
Name	Description	Value
→ Procore-Company-Id	Procore-Company-Id	31153

Generic REST Instance – Parameters

This section is only shown if connector level parameters are defined in the Rest Service Definition.

Name	The name of the header as outlined in the REST API documentation.
Description	A friendly description for the header.
Value	The value to be used by the header.

The screenshot shows the 'Generic REST Instance Setup' dialog box. At the top, there are 'Save' and 'Cancel' buttons. Below them is the 'Settings' section. Under 'Settings', 'Rest Service' is set to 'Procore' and 'Name' is also 'Procore'. There are five tabs: 'Instructions', 'Authentication', 'Headers', 'Parameters' (which is selected), and 'Variables'. The 'Parameters' tab contains a table with three columns: 'Name', 'Description', and 'Value'. The table has one row with the value 'company_id' in the 'Name' column, 'company_id' in the 'Description' column, and '31153' in the 'Value' column. A small arrow icon is visible to the left of the 'company_id' in the 'Name' column.

Name	Description	Value
→ company_id	company_id	31153

Generic REST Instance – Variables

This section is only shown if variables are defined in the Rest Service Definition.

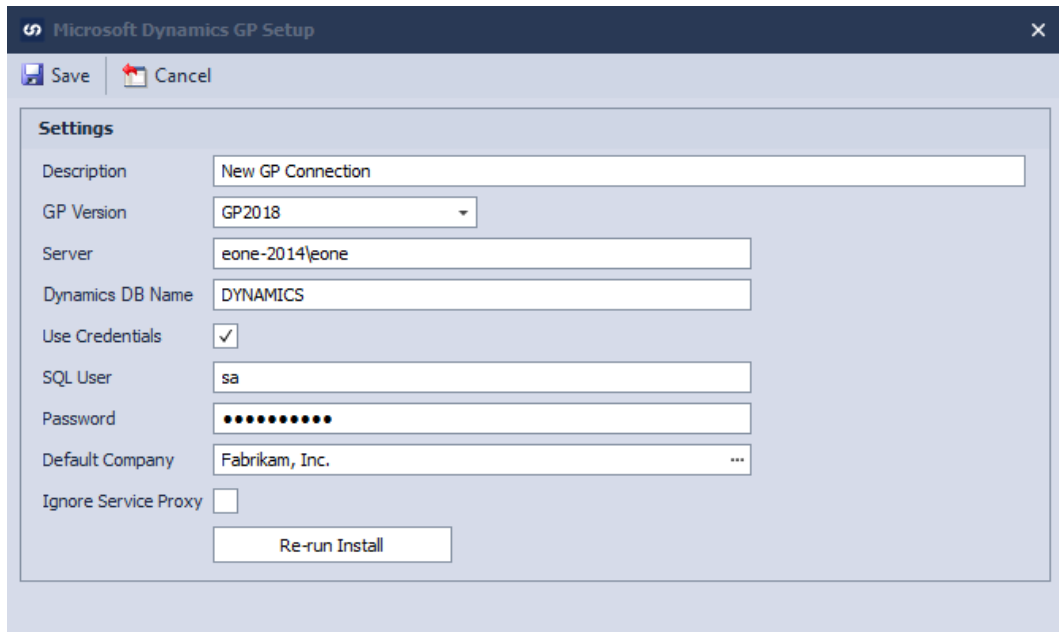

Name	The unique name for the variable.
Description	A friendly description for the variable.
Value	The default value for the variable.

The screenshot shows the 'Generic REST Instance Setup' dialog box. The 'Variables' tab is selected, displaying a table of defined variables. The table has three columns: Placeholder, Description, and Value. The variables listed are project_id (value 68693), contract_id (value 25119), and standard_cost_code_list_id (value 38517). The 'standard_cost_code_list_id' row is highlighted with a mouse cursor.

Placeholder	Description	Value
project_id	project_id	68693
contract_id	contract_id	25119
→ standard_cost_code_list_id	standard_cost_code_list_id	38517

Microsoft Dynamics GP

Description	Name given to the new Connection.
GP Version	Options include GP 2010, 2013, 2015, 2016 and 2018.
Server	SQL Server where the Dynamics Database is located.
Dynamics DB Name	Name of the Dynamics Database.
Use Credentials	If checked, entered the SQL user and password to connect to the MSSQL Server. If not checked, windows authentication will be used to connect to the GP Databases.
SQL User	SQL User used to connect to MSSQL Server.
Password	Password for the SQL User.
Default Company	Company that will be used by default.
Ignore Service Proxy	Check if the eConnect windows service should not be used to upgrade Dynamics GP. If the eConnect windows service is not used the windows credentials of the currently logged in windows user will be used to connect to Dynamics GP.
Re-run Install	Recreates the SmartConnect eOne Stored Procedures.

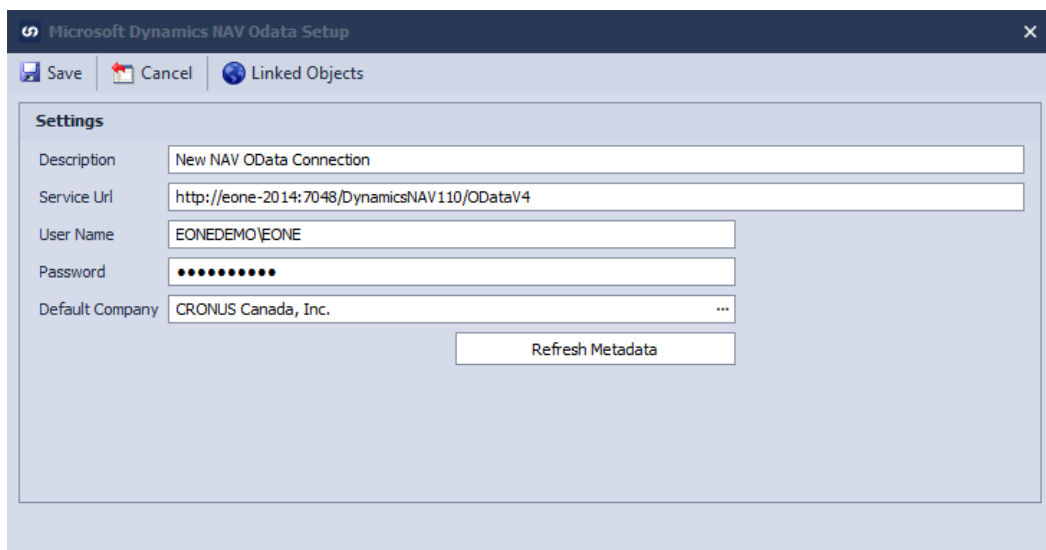

The screenshot shows the 'Microsoft Dynamics GP Setup' window with the 'Settings' tab selected. The window has a title bar with a close button (X) and a toolbar with 'Save' and 'Cancel' buttons. The 'Settings' section contains the following fields and controls:

- Description:** Text box containing 'New GP Connection'.
- GP Version:** Dropdown menu set to 'GP2018'.
- Server:** Text box containing 'eone-2014\jeone'.
- Dynamics DB Name:** Text box containing 'DYNAMICS'.
- Use Credentials:** Checkmark is selected.
- SQL User:** Text box containing 'sa'.
- Password:** Text box filled with dots.
- Default Company:** Text box containing 'Fabrikam, Inc.' with a dropdown arrow on the right.
- Ignore Service Proxy:** Unchecked checkbox.
- Re-run Install:** A button located below the 'Ignore Service Proxy' checkbox.

Microsoft Dynamics NAV ODataV4

Description	Name given to the new Connection.
Service Url	Enter your Service URL in the following format: http://<server qualified name>/<Instance Name>/ODataV4.
User Name	Username of the User with access.
Password	Password for the User being used.
Default Company	Company that will be used by default.
Refresh Metadata	Click to refresh the metadata of the NAV Tenant.

The screenshot shows the 'Microsoft Dynamics NAV Odata Setup' dialog box. It has a title bar with a close button. Below the title bar is a ribbon with 'Save', 'Cancel', and 'Linked Objects' buttons. The main area is titled 'Settings' and contains the following fields:

- Description:** A text box containing 'New NAV OData Connection'.
- Service Url:** A text box containing 'http://eone-2014:7048/DynamicsNAV110/ODataV4'.
- User Name:** A text box containing 'EONEDEMO\EONE'.
- Password:** A text box with masked characters (dots).
- Default Company:** A dropdown menu showing 'CRONUS Canada, Inc.' with a three-dot menu icon to its right.

Below these fields is a 'Refresh Metadata' button.

Microsoft Dynamics NAV SOAP

Description	Name given to the new Connection.
Service URL	Enter your Service URL in the following format: http://<server qualified name>/<Instance Name>/WS.
Use NTLM	Needs to be enabled if the NAV instance is setup to use NTLM Auth.
Domain	Domain of the User with access.
User Name	Username of the User with access.
Password	Password for the User being used.
Default Company	Company that will be used by default.

Microsoft SQL Server

Description	Name given to the new Connection
Server	SQL Server being connected to.
Authentication	Either SQL Server Authentication or Windows Authentication. Note: If using Windows Authentication, the Login and Password fields will not be used.
Login	User used to login using SQL Server Authentication.
Password	Password of the login user.
Database	Default Database used.

The screenshot shows the 'Microsoft Sql Server Setup' window. At the top, there are 'Save' and 'Cancel' buttons. Below them is a 'Settings' section with the following fields:

- Description:** New SQL Connection
- Server:** HANSEL-LAPTOP\SQLEXPRESS
- Authentication:** Use SQL Server Authentication (dropdown menu)
- Login:** sa
- Password:** [masked with dots]
- Database:** tempdb

Below the password field, there is a green checkmark icon and the text 'Successfully connected'.

ODBC

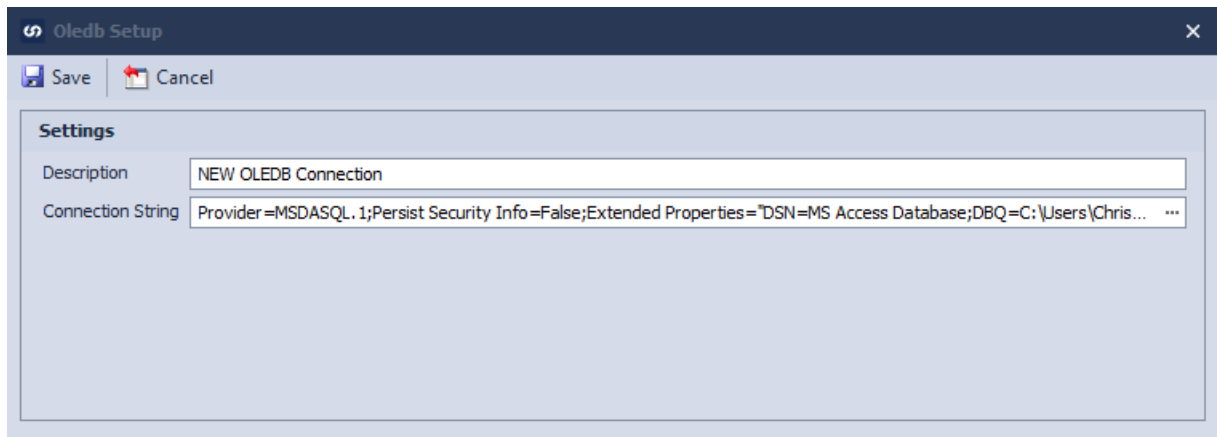

Description	Name given to the new Connection.
Connection String	Select the lookup option to define the connection string and then fill in the details required by that connection string. If a connection defined by a DSN on the computer is required select the 'Select a DSN' option.

The screenshot shows the 'Odbc Setup' window. At the top, there are 'Save' and 'Cancel' buttons. Below them is a 'Settings' section with the following fields:

- Description:** New ODBC Connection
- Connection String:** DBQ=C:\Users\ChrisHanson\OneDrive - eOne Integrated Business Solutions\Documents\Database1.accdb;Defa... (with an ellipsis button)

OleDb

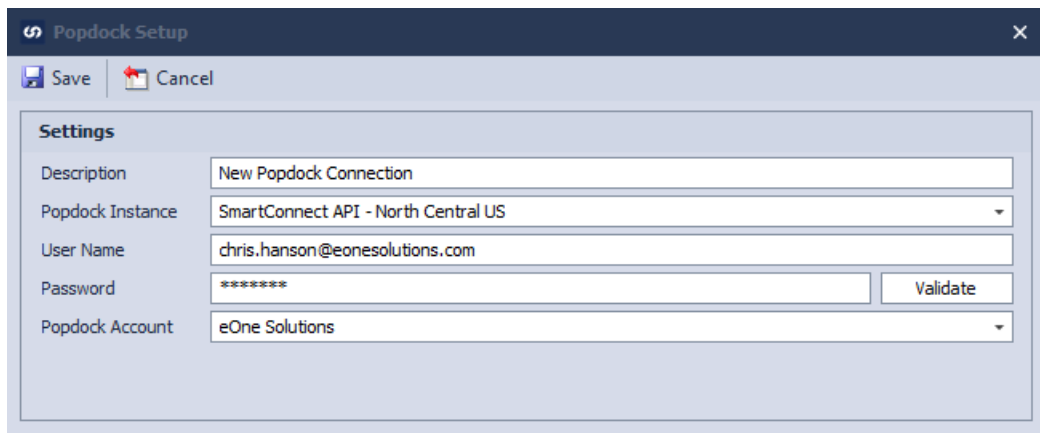

Description	Name given to the new Connection.
Connection String	Select the lookup option to define the connection string and then fill in the details required by that connection string.

The screenshot shows the 'OleDb Setup' dialog box. It has a title bar with a close button. Below the title bar are 'Save' and 'Cancel' buttons. The main area is titled 'Settings' and contains two text input fields. The first field is labeled 'Description' and contains the text 'NEW OleDb Connection'. The second field is labeled 'Connection String' and contains the text 'Provider=MSDASQL.1;Persist Security Info=False;Extended Properties='\"DSN=MS Access Database;DBQ=C:\Users\Chris...\"'. There is a small '...' button to the right of the second field.

Popdock

Description	Name given to the new Connection.
Popdock Instance	Select the Popdock Instance needed.
User Name	Enter the Username of the user with access.
Password	Enter the User's password.
Popdock Account	Select the Popdock Account you want to connect to.

The screenshot shows the 'Popdock Setup' dialog box. It has a title bar with a close button. Below the title bar are 'Save' and 'Cancel' buttons. The main area is titled 'Settings' and contains five input fields. The first field is labeled 'Description' and contains the text 'New Popdock Connection'. The second field is labeled 'Popdock Instance' and is a dropdown menu with the text 'SmartConnect API - North Central US'. The third field is labeled 'User Name' and contains the text 'chris.hanson@eonesolutions.com'. The fourth field is labeled 'Password' and contains the text '*****'. To the right of the password field is a 'Validate' button. The fifth field is labeled 'Popdock Account' and is a dropdown menu with the text 'eOne Solutions'.

Salesforce

Description	Name given to the new Connection.
Create Tests	Checking “Create Tests” will create the necessary apex tests in order to promote your sandbox objects to production.
Sandbox/Production	<p>Click the Sandbox Tab to setup a Connection to a Salesforce Sandbox Organization.</p> <p>Click the Production Tab to setup a Connection to a Salesforce Production Organization.</p> <p>Note: Both Sandbox and Production can be setup on one Connection.</p>
Default Security	Setup the Default Security to connect to the Salesforce Organization.
Administration Security	<p>If an administrative user is to be used to connect to Salesforce to perform administrative functions setup the Administration Security.</p> <p>Note: The Administration Security details will automatically be set to the Default Security details after saving the connection if the details are left empty.</p>
Username	Enter the Salesforce username.
Password	Enter the Salesforce password for the user.
Security Token	<p>Enter the Security Token for the user.</p> <p>Note: To reset the Security Token</p> <ol style="list-style-type: none">1. Log into Salesforce and click on “View Profile”.2. Click on “Settings”.3. Click “Reset My Security Token” under the “My Personal Information” tab.
Test	<p>Click the “Test” button on the Default Security setup section once all the details have been entered.</p> <p>Note: Make sure a Salesforce Service URL is entered before clicking “Test”.</p>
Salesforce Service URL	<p>The Salesforce Service URL will need to be manually entered for the Sandbox Tab. The URL will be in the following format <a href="https://<Location>.salesforce.com/services/Soap/u/48.0">https://<Location>.salesforce.com/services/Soap/u/48.0 To find the “Location”</p> <ol style="list-style-type: none">1. Log into the Production salesforce and go to Setup.2. Go to Platform Tools > Environments > Sandboxes.3. Look at the Sandbox you want to use and grab the Location value.
Organization	<p>The Salesforce Service URL will be defaulted on the Production Tab.</p> <p>The name of the Organization being connected to.</p>

	Note: This field will auto-populate after receiving a successful “Test” and it is read only.
Organization Type	The type of Organization being connected to.
	Note: This field will auto-populate after receiving a successful “Test” and it is read only.
Security Profiles	When setting up new objects in Salesforce (e.g., change and realtime entities) we need to give access to those objects before users can write to them or query them. If a security profile is selected on this window, then that profile will be given access to the new object. If they are not selected that profile will not have access.
Duplicate Aliases	In Salesforce you can set up two objects that have the same display name. SmartConnect would then show two objects with the same display name. In the Duplicate Aliases window, you can link a new display name that will show inside SmartConnect with the object technical name.
Reset All Tests	This will reset the tests that got created back to their default setting.

The image shows a 'SalesForce Setup' window with a title bar containing a gear icon, the text 'SalesForce Setup', and a close button. Below the title bar are 'Save' and 'Cancel' buttons. The main content area is titled 'Settings' and contains several sections:

- Description:** A text field with the value 'New Salesforce Connection'.
- Create Tests:** An unchecked checkbox.
- Environment Tabs:** Two tabs, 'Sandbox' and 'Production', with 'Sandbox' currently selected.
- Default Security:** A section containing:
 - Username:** 'chris.hanson@eonesolutions.com'
 - Password:** A field with masked characters '*****'.
 - Security Token:** A field with masked characters '*****'.
 - Test Button:** A button with a gear icon and the text 'Test'.
- Administration Security:** A section containing:
 - Username:** 'chris.hanson@eonesolutions.com'
 - Password:** A field with masked characters '*****'.
 - Security Token:** A field with masked characters '*****'.
 - Test Button:** A button with a gear icon and the text 'Test'.
- SalesForce Service:** A section containing:
 - SalesForce Service Url:** 'https://login.salesforce.com/services/Soap/u/48.0'
 - Organization:** 'eOne Solutions'
 - Organization Type:** 'Developer Edition'

At the bottom of the window are three buttons: 'Security Profiles', 'Duplicates Aliases', and 'Reset All Tests'.

Connections – Navigation – Open

Opens the selected connection for editing.

Connections – Navigation – Delete

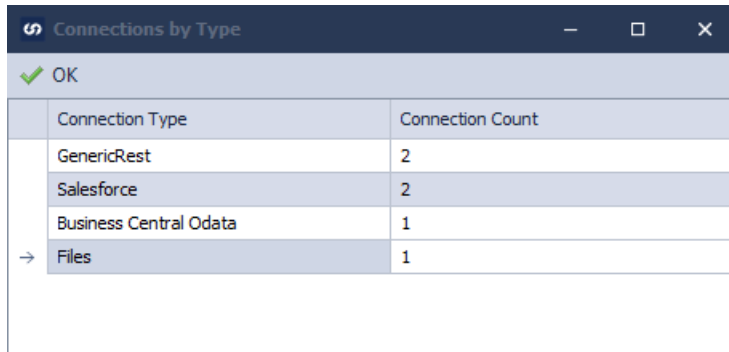

Deletes the selected connection. Connections cannot be deleted if they are in use by a data source or integration process.

Connections – Navigation – Refresh

Refreshes the list of connections to show any changes made by other users since the window was opened.

All Connections

This window will show a summary of all the connections used by the current instance of SmartConnect.

Connections by Type	
OK	
Connection Type	Connection Count

Query Builder

The Query Builder information has been divided into the following topics:

- The Query Builder Window
- Adding Query Objects
- Selecting Fields
- Adding Criteria
- Joins and Links
- Grouping and Sorting
- Properties
- Sub Queries
- Unions
- Derived Tables

Query Builder Window

SQL Tab

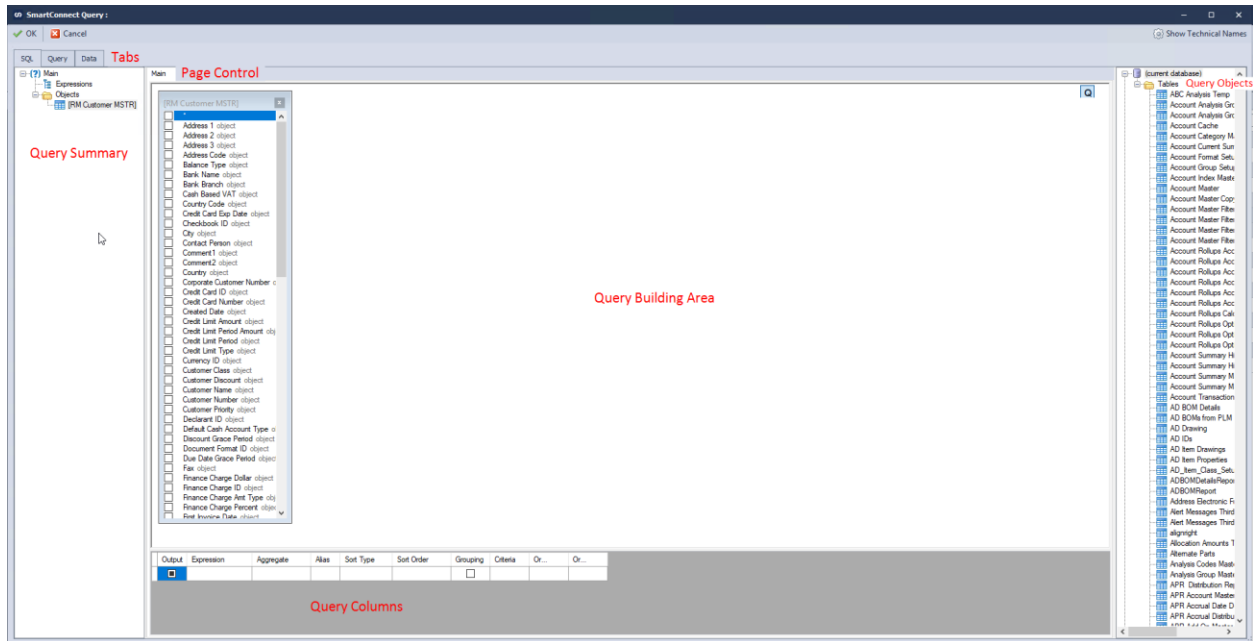

- Query Summary - the area on the left of the Query Builder window where columns, restrictions, groupings will be displayed in a summary format.
- Query Building Area- the main area where the visual representation of the query is shown. This area allows definition of source database objects and derived tables, define links between them, and configure properties of tables and links.
- Query Columns - located below the query building area. It is used to perform all the necessary operations with query output columns and expressions. Here field aliases, sorting and grouping, and selection criteria may be defined.
- Query Objects - on the right side of the Query Builder window. This area displays all the data source objects for the current connection. From here objects may be dragged onto the main query building area or doubled clicked to have them move to the query building area.
- Page Control - allows switching between the main query and any sub-queries that may have been defined.
- Union Handler - allows adding of new sub-queries.

Query Tab

- As the query is built through Query Builder, the SQL code may be viewed on the query tab. This code is view only and may not be changed through this tab.

Data Tab

- Data returned from the query may be viewed on the data tab.

Query Builder Adding Objects

An object may be added to the Query Building Area by dragging and dropping the required object from the Query Objects area or double clicking the object from the Query Objects area. Alternatively, right-click the query building area and select Add Object from the drop-down menu. This will then open the Add new object window.

The add new object window allows the selection of multiple objects at once. The objects are grouped into Tables, Views and Procedures according to the object type. One or more objects may be selected by holding the Control key down, selecting the required object(s), then selecting Add Selected Objects. After all required objects have been added select close to close the window.

For connections that have schemas, or allow selections from different databases, objects may be filtered by database or schema name by selecting the necessary schema or database from the combo box at the top of the window.

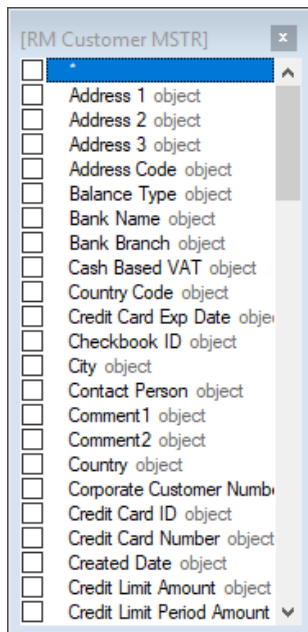

To remove an object from the query, select the object then hit the Delete key, or click close in the object header.

Objects added to the Query Building Area may be aliased by double-clicking the object header.

Query Builder Selecting Fields

To add a field to the list of query output fields, check the checkbox next to the field name in the Query Building area. To include all fields, select the asterisk item at the top of the object.

Fields may also be selected by selecting the field name from the drop-down list of the Expression column in the Query Columns area.

To remove a field from the list of query output fields, uncheck the checkbox next to the field name in the Query Building area. Alternatively, it may be removed by de-selecting the checkbox in the Output column of the Query Columns area.

Fields can also be moved around in the Query Columns section. Can Move up, Move down, Remove, or insert an empty item.

Output	Expression	Aggregate	Alias	Sort Type	Sort Order	Grouping	Criteria for	Criteria	Or...	Or...
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Customer Number]			Descending	1	<input checked="" type="checkbox"/>	For groups			
<input type="checkbox"/>	[RM Customer MSTR].[Customer Name]					<input type="checkbox"/>	For values			
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Address 1]			Ascending	2	<input checked="" type="checkbox"/>	For values			
<input type="checkbox"/>	[RM Customer MSTR].[Address 2]									
<input type="checkbox"/>	[RM Customer MSTR].[City]									
<input checked="" type="checkbox"/>										

Move up
Move down
Remove item
Insert empty item
Alt-Up
Alt-Down
Alt-Delete
Alt-Insert

Query Builder Adding Criteria

To define criteria for the expression listed in the Query Columns area the Criteria column should be used.

In the criteria column enter the criterion (omitting the expression) i.e.

To enter a criteria of WHERE (field >= 10) AND (field <= 20)

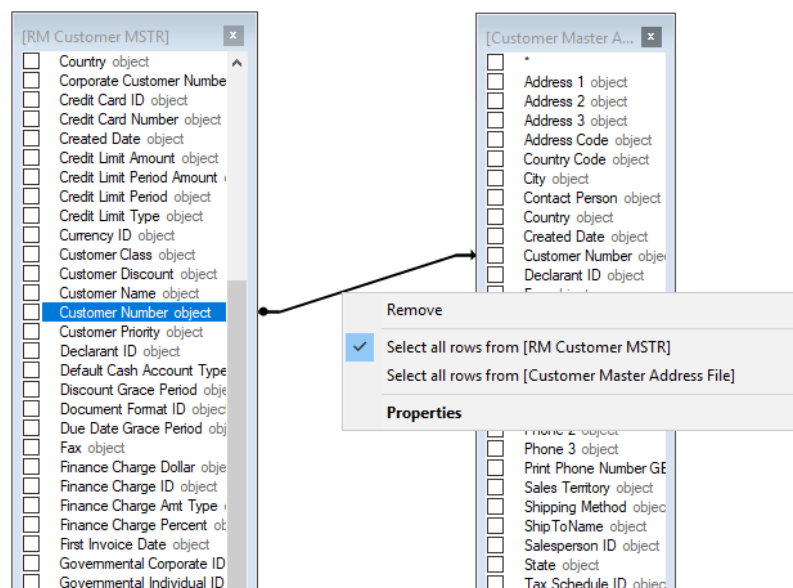

>= 10 AND <= 20 should be entered.

Multiple criteria for a single expression may be used using the 'Or' operator.

Output	Expression	Aggregate	Alias	Sort Type	Sort Order	Grouping	Criteria	Or...	Or...
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Customer Number]		CUSTNUM	Ascending	1	<input type="checkbox"/>			
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Customer Name]					<input type="checkbox"/>	= 'Test Name'	= 'Test Name 2'	
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Address 2]					<input type="checkbox"/>			
<input checked="" type="checkbox"/>	[RM Customer MSTR].City					<input type="checkbox"/>			
<input checked="" type="checkbox"/>	[RM Customer MSTR].Country					<input type="checkbox"/>			
<input type="checkbox"/>						<input type="checkbox"/>			

Query Builder Joins and Links

To create a link between two objects in the Query Building Area select the field to be linked with the other object, then drag it to the corresponding field on the second object. After the drag is finished a line connecting the two objects will appear.

The default join type is INNER JOIN. i.e. only matching records of both tables will be included in the result set. To define other types of joins right click the link and select the properties item in the drop-down menu, or simply double-click the link line. The dialog allows further definition of link properties.

Link Properties

Left Object

[RM Customer MSTR]

☒ Select All From Left

Right Object

[Customer Master Address File]

Select All From Right

☐

Join Expression

[Customer Number] = [Customer Master Address File].[Customer Number]

OK

Cancel

To remove a link between objects, right-click the link line and select the Remove item from the drop-down menu.

Query Builder Grouping and Sorting

To enable sorting of output query fields the Sort Type and Sort Order columns of the Query Columns area should be used.

- The sort type column allows selection of the way columns will be sorted (ascending, descending)
- The sort order column allows the order in which fields will be sorted to be defined.
- To disable sorting by a specific field, clear the sort type column for that field.

Output	Expression	Aggregate	Alias	Sort Type	Sort Order	Grouping	Criteria	Or...	Or...
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Customer Number]			Descending	1	<input type="checkbox"/>			
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Customer Name]					<input type="checkbox"/>			

To define grouping by some of the fields, and / or to define aggregate functions on the grouped rows the Group By checkbox column in the Query Columns area should be used.

- When defining groupings and using criteria the query must define if the given criteria is for the group or for elements contained within the group.
- By selecting an aggregate function (count, sum etc) an aggregate expression will be created for the value indicated in the Expression column.

Output	Expression	Aggregate	Alias	Sort Type	Sort Order	Grouping	Criteria for	Criteria	Or...	Or...
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Customer Number]			Descending	1	<input checked="" type="checkbox"/>	For groups			
<input type="checkbox"/>	[RM Customer MSTR].[Customer Name]					<input type="checkbox"/>	For values			
<input checked="" type="checkbox"/>	[RM Customer MSTR].[Address 1]			Ascending	2	<input checked="" type="checkbox"/>	For values			
<input type="checkbox"/>	[RM Customer MSTR].[Address 2]					<input type="checkbox"/>	For values			
<input type="checkbox"/>	[RM Customer MSTR].[City]					<input type="checkbox"/>	For values			
<input checked="" type="checkbox"/>						<input type="checkbox"/>	For values			

Query Builder Properties

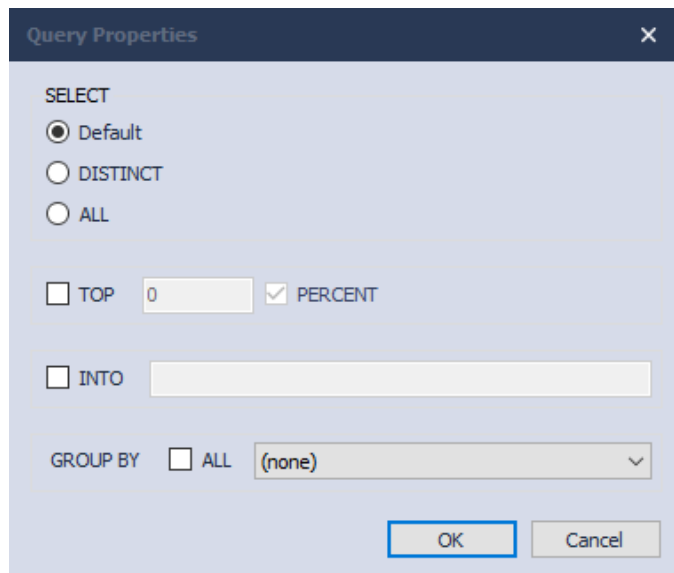

To open the Query Properties window either double click the Query Building area or right click the Query Building area and select Properties.

The Select statement can be either Default, DISTINCT, or ALL. (Note: The Default and All options will return the same result.) DISTINCT will return only distinct (different) values from the column.

To select only a certain number of records, click the “Top” checkbox and then enter a number of records to return. Also, you can return a percentage of records by clicking the “Percent” checkbox.

Check the “Into” checkbox if you want to send the data into another table.

Check the “ALL” checkbox if you want the group by statement to display all groups including those excluded in the WHERE clause. Also, there are options to group by “With Rollup” or “With Cube”. With Rollup is used to calculate sub-totals and grand totals. With Cube is used to generate all combinations of columns specified in the group by clause.

Query Properties

SELECT

☒ Default

☐ DISTINCT

☐ ALL

☐ TOP ☒ PERCENT

☐ INTO

GROUP BY ☐ ALL

OK Cancel

Query Builder Sub Queries

Sub-queries may be added as part of an expression or criterion using the columns pane.

To add a new sub-query, click on the Expression, Aggregate or Criteria columns of the Query Columns pane, then select the Insert Sub-Query item from the drop-down menu.

Expression	Aggregate
[RM Customer MSTR].[Customer Number]	Sum
[RM Customer MSTR].[Address 1]	
[RM Customer MSTR].[Address 2]	
[RM Customer MSTR].[Address 3]	

The corresponding tab will be created after adding the sub-query. This tab allows the sub-query to be edited visually in the same way as the main query.

Query Builder Unions

Union sub-queries can be worked with by using the small panel in the top right corner of the Query Building area. Initially there is only one union sub-query labeled with the Q letter. All required operations are performed by means of context (right click) drop down menus.

- To add a new union subquery, select the New Union Sub Query menu item.
- To enclose the sub query in brackets, select the Enclose in Brackets menu item. Right click on the brackets to either move them or remove them.
- To move the sub-query or bracket to the top of the query select the Move Backward menu item.

- To move the sub-query or bracket to the bottom of the query select the Move Forward menu item.
- To remove the sub-query or bracket select the Remove menu item.
- To change the union operator, select the necessary operator from the list of supported operators in the drop-down menu.

Query Builder Derived Tables

Derived tables (a sub-query in the from clause of the query) may be created using the Query Building area. To add a derived table right click on the Query Building area and select the Add Derived Table option from the drop-down menu.

A new object representing the newly created derived table will be added to the query building area of the main query. In addition, the corresponding tab will be created after adding the derived table. This tab allows edit of the sub-query in the same way as the main query is edited. Another way to switch to the sub-query is to select the maximize button at the header of the object representing the derived table.

Data Sources – Navigation – Open

Opens the selected data source for editing.

Data Sources – Navigation – Delete

Deletes the selected data source. Data sources cannot be deleted if they are in use by an integration process.

Data Sources – Navigation – Refresh

Refreshes the list of data sources to show any changes made by other users since the window was opened.

Integrations

Integrations – Navigation – Create

The Integration Process window is the only location in SmartConnect where a new integration can be created or modified. There are several components and sub-windows broken out across the Integration Process window.

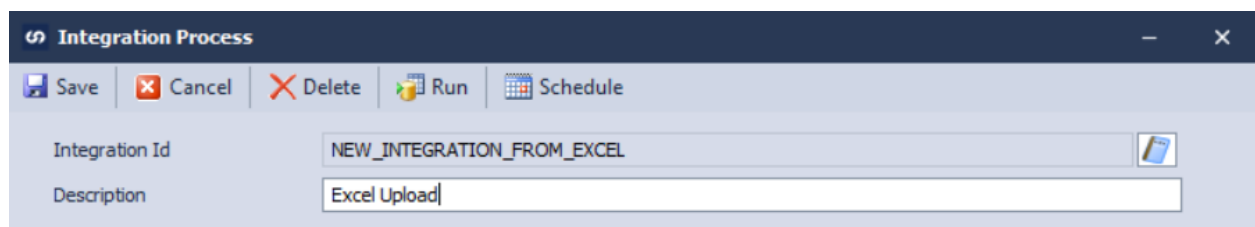

When an integration is opened in the Integration Process window it sets the integration to edit-mode and until the integration is saved or closed out of it cannot be edited by another user or executed by the scheduling service.

The main action buttons across the top of the Integration Process window are defined below:

Save	Saves the current integration process that is open.
Cancel	Cancels any changes made to the integration process and closes it.
Delete	Deletes the current integration process.
Run	Saves and then executes the current integration process.

There are also two identifying fields for any integration and a note process:

Integration ID	The ID for the integration. This cannot be changed after being set.
Description	The description used to help identify the integration process.
<Note Icon>	Allows users to add timestamped notes to the integration to track modifications or improvements.

The screenshot shows the 'Integration Process' window with a dark blue title bar. Below the title bar is a toolbar with five buttons: 'Save' (floppy disk icon), 'Cancel' (red X icon), 'Delete' (red X icon), 'Run' (play icon), and 'Schedule' (calendar icon). Below the toolbar are two text input fields. The first field is labeled 'Integration Id' and contains the text 'NEW_INTEGRATION_FROM_EXCEL'. The second field is labeled 'Description' and contains the text 'Excel Upload'. To the right of the 'Integration Id' field is a small icon of a notepad and pencil.

Integration Process – Source

The Source panel in the Integration Process window allows a previously configured data source to be utilized by the integration.

Data Source Type	The main data source type of File/Folder, Bulk, Change, or Real-Time. Selection affects what shows in the Data Source field below.
Data Source	The data sources that have been previously configured will show here based on the type selected.
Data Source Keys	The data source keys will determine how the source data is split into separate records for processing. Each unique key or combination of keys will be treated as a separate record.
Preview	Returns a handful of records from the selected data source.

The screenshot shows the 'Integration Process' window with the 'Source' panel selected. The window has a title bar with a minus, maximize, and close button. Below the title bar is a toolbar with 'Save', 'Cancel', 'Delete', 'Run', and 'Schedule' buttons. The main area is divided into sections: 'Integration Id' (NEW_INTEGRATION_FROM_EXCEL), 'Description' (Excel Upload), and a tabbed interface with 'Source & Destination', 'Options', 'Tasks', and 'Variables' tabs. The 'Source & Destination' tab is active, showing the 'Data Source' section with 'Data Source Type' (File / Folder), 'Data Source' (New Excel File), and 'Data Source Keys' (CustomerID). A 'Preview' button is located below the 'Data Source Keys' field. The 'Destination' section is currently empty.

Integration Process – Destination

Integration Process – Destination – Dynamics 365 Business Central ODataV4

Instance	Select the BC OData Connector Instance.
Services	Select the BC Services needed for the integration.
Include linked entities	If checked, the linked entities of the Services selected will show as available integration lines. If not checked, the linked entities will not show.
Remove blank properties	Check to remove blank values before it sends to BC.
Ignore Update Conflicts	Check to Ignore any updates conflicts that could happened when 2 users update the same record at the same time.
Send to file	If checked, select the file path where the data can be sent to. Note: The data will not be integrated into Business Central if this option is checked. If not checked, the integration will run to Business Central like normal.

The screenshot shows the 'Integration Process' window with the 'Destination' tab selected. The 'Integration Id' is 'NEW_INTEGRATION' and the 'Description' is 'Data Integration'. Under 'Destination', the 'Destination Type' is 'Dynamics 365 Business Central Odata'. In the 'Settings' section, the 'Instance' is 'New Business Central ODataV4 Connection' and 'Services' are 'CustomerCard,SalesInvoice'. Checkboxes for 'Include linked entities' (checked), 'Remove blank properties' (unchecked), and 'Ignore Update Conflicts' (unchecked) are present. There is an unchecked 'Send to file' checkbox and a 'Companies' button. Below is the 'Available Lines' table:

	Description	Grouped	Mapped
→	CustomerCard	<input type="checkbox"/>	<input type="checkbox"/>
	SalesInvoice	<input type="checkbox"/>	<input type="checkbox"/>
	SalesInvoiceSalesLines	<input type="checkbox"/>	<input type="checkbox"/>

Buttons for 'Map' and 'Delete Mapping' are at the bottom right of the table area.

Integration Process – Destination – Dynamics 365 Business Central SOAP

Instance	Select the BC Soap Connector Instance.
Service Name	Select the BC Service needed for the integration.
Service Url	The Service URL used to connect to the BC Service.
To File	<p>If checked, select the file path where the data can be sent to.</p> <p>Note: The data will not be integrated into Business Central if this option is checked.</p>
File Path	<p>If not checked, the integration will run to Business Central like normal.</p> <p>Select the file path, if the “To File” option is checked.</p>

The screenshot shows the 'Integration Process' window with the 'Destination' tab selected. The 'Data Source' is 'NEW_INTEGRATION' and the 'Description' is 'Data Integration'. Under 'Destination', the 'Destination Type' is 'Dynamics 365 Business Central Soap'. In the 'Settings' section, the 'Instance' is 'New Business Central SOAP Connection', 'Service Name' is 'CustomerCard', and 'Service Url' is 'https://api.businesscentral.dynamics.com/v2.0/93f1edcf-e187-4d27-a66...'. The 'To File' checkbox is unchecked. Below the settings is a table of 'Available Lines' with columns for 'Description', 'Grouped', and 'Mapped'. The table lists 'Customer Card', 'Aged Acc Receivable Chart', and 'Delete Customer Card'. At the bottom right are 'Map' and 'Delete Mapping' buttons.

- Buttons:** Map, Delete Mapping

Destination – Export to File – Edit Columns

The “Edit Columns” button will allow you to change the Names on the Destination Fields.

For example, we could change the “No” field under Destination Name to “Number”.

The dialog box titled "Set Destination Columns" contains a table with two columns: "Source Name" and "Destination Name". The table lists various fields, including "No", "Name", "Name_2", "Search_Name", "IC_Partner_Code", "Balance_LCY", "Balance_Due_LCY", "Credit_Limit_LCY", "Blocked", "Privacy_Blocked", "Salesperson_Code", "Responsibility_Center", and "Service_Zone_Code". The "No" field in the "Destination Name" column is highlighted, indicating it is the current selection for editing.

Source Name	Destination Name
No	No
Name	Name
Name_2	Name_2
Search_Name	Search_Name
IC_Partner_Code	IC_Partner_Code
Balance_LCY	Balance_LCY
Balance_Due_LCY	Balance_Due_LCY
Credit_Limit_LCY	Credit_Limit_LCY
Blocked	Blocked
Privacy_Blocked	Privacy_Blocked
Salesperson_Code	Salesperson_Code
Responsibility_Center	Responsibility_Center
Service_Zone_Code	Service_Zone_Code

Integration Process – Destination – Dynamics CRM

CRM Instance	Select the CRM Connector Instance.
Entities to Process	Select the Entities needed for the Integration.
Entity Technical Names	Displays the Entity Technical Names. This field is read only.
Include advanced messages	If checked, the advanced messages of the Services selected will show as available integration lines. If not checked, the linked entities will not show.
Reference Data	Click the lookup to open the Reference Lookup window.
Ignore Duplicate Detection Rules	If duplicate detection rules on the CRM server should be ignored when creating or updating records, select the Ignore Duplicate Detection Rules checkbox.
To File	If checked, select the file path where the data can be sent to. Note: The data will not be integrated into CRM if this option is checked. If not checked, the integration will run to CRM like normal.

The screenshot shows the 'Integration Process' window with the 'Destination' tab selected. The 'Data Source' is 'Data Integration'. The 'Destination Type' is 'Microsoft Dynamics CRM'. The 'Settings' section includes:

- CRM Instance:** New CRM Connection
- Entities to Process:** Account, Order, Order Product
- Entity Technical Names:** account, salesorder, salesorderdetail
- Include advanced messages:** ☐
- Reference Data:**
- Ignore Duplicate Detection Rules:** ☐
- To File:** ☐

Below the settings is a section for 'Organizations'. At the bottom, there is a table of 'Available Entities' with columns for Description, Grouped, and Mapped.

Description	Grouped	Mapped
→ Account (account)	<input type="checkbox"/>	<input type="checkbox"/>
Order (salesorder)	<input type="checkbox"/>	<input type="checkbox"/>
Order Product (salesorderdetail)	<input type="checkbox"/>	<input type="checkbox"/>

Buttons at the bottom right: Map, Delete Mapping.

Integration Process – Destination – Dynamics GP

Instance	Select the GP Connector Instance.
Group	Select the Group.
Node Type	Select the Node Type being integrated to.
Destination Type	Either Normal or File. Select “Normal” to have your data integrate into GP. Select “File” to have your data sent to a file instead of into GP. This is especially useful when either setting up a new integration or troubleshooting as the exact information that would be sent to GP can be viewed without sending the data to Dynamics GP.
Path	Enter the path for the send to file option. This option will only be available if “File” is the Destination Type.
Add Extender Object	Click to Add an Extender Object.

The screenshot shows the 'Integration Process' window with the 'Destination' tab selected. The 'Data Source' is 'NEW_INTEGRATION' and the 'Description' is 'Data Integration'. Under 'Destination', the 'Destination Type' is set to 'Microsoft Dynamics GP'. In the 'Settings' section, 'Instance' is 'Microsoft GP', 'Group' is 'Receivables', 'Node Type' is 'Customers', and 'Destination Type' is 'File'. The 'Path' field is empty, and there is an 'Add Extender Object' button below it. A 'Companies' button is also present. At the bottom, there is a table of 'Available Nodes' with columns for 'Description', 'Grouped', and 'Mapped'. The table lists five nodes: 'Create/update customer', 'Add customer address', 'Create parent customer', 'Create child customer', and 'Create Internet Address'. Each node has checkboxes for 'Grouped' and 'Mapped'. 'Map' and 'Delete Mapping' buttons are at the bottom right.

Description	Grouped	Mapped
→ Create/update customer	<input type="checkbox"/>	<input type="checkbox"/>
Add customer address	<input type="checkbox"/>	<input type="checkbox"/>
Create parent customer	<input type="checkbox"/>	<input type="checkbox"/>
Create child customer	<input type="checkbox"/>	<input type="checkbox"/>
Create Internet Address	<input type="checkbox"/>	<input type="checkbox"/>

Destination – Dynamics GP – Add Extender Object

Select the (+) button to add an Extender object to the Extender object list.

GP Company	Select the Dynamics GP company that contains the Extender object.
Extender Type	Select the Extender type, available options are Form and Window.
Extender Node	<div>Select the Extender node to be used valid options for each Extender type are listed below:<ul style="list-style-type: none">Forms<ol style="list-style-type: none">Form : Add Update - allows creation and update of Extender forms.Form : Delete - allows deletion of Extender forms.Form Detail Line : Add Update - allows creation and update of detail lines on Extender forms. Integration Process – Destination – SmartConnect Mapping

The SmartConnect mapping window gives field-level control to designing integrations. This window will vary slightly depending on the destination chosen, but much of the setup will remain the same.

The basic layout allows for any source fields and any additional columns that are created to be listed in the left grid, while any available destination fields are listed in the right grid. Fields can be mapped by dragging them from the left grid to the right grid, or by clicking in the Column Name and selecting the value from the drop-down list.

The main toolbar buttons are defined as follows:

OK	Saves any work performed in the mapping window and closes it.
Cancel	Discards any work performed in the mapping window and closes it.
Preview	Attempts to preview the data source based on the grouping set within the mapping window. This may not be allowed if additional columns must be grouped on.
Restrictions	Opens the restriction window, defined later in this document.
Additional Columns	Open the Additional Columns window, defined later in this document.
Destination Options	Allows fields to be auto matched on name for most destinations. File-based destinations have additional options based on type selected.

The checkboxes available on the mapping window are as follows:

Update Existing	If unchecked, the mapping will attempt to only insert records. If checked, both inserts and updates will be performed – upserts for destinations that allow it.
Update Blank Data	Available based on destination. If unchecked, passing a blank value through on a field will not remove an existing value in the destination system. If checked, existing values can be replaced with blank values on updated records.
For Delete	Available based on destination. When checked, any records that match the source fields which have been grouped on will be deleted from the destination system. Use caution marking this option.
Group Data	May be required for some destinations. Checking the group data option allows the data to be grouped beyond how the data source keys break the data apart into separate records.
Show Required Only	Checking this option will show only destination fields which are flagged as required by the destination system.

Map ID: NEW_INTEGRATION_FROM_EXCEL ☒ Update existing ☐ For Delete

Map Description: Excel Upload

Mapping: Customer ☒ Group data ☐ Show Required Only

There are columns within the grids that can be interacted with on the mapping window as well:

Source Columns - Function	Visible only when the Group Data option is checked. Allows a function to be applied to the data based on the grouping.
Source Columns – Group On	Any field selected in the Group On column will cause the mapping to group the data on that combination of fields checked, along with the data source keys.
Destination Columns – Column Type	Column type can be switched to display a different value. This is useful for when using the drop-down option for Column Name. It will automatically change when using drag and drop to map the source fields.
Destination Columns – Column Name	Will display whatever source field/additional column has been mapped to each destination field. To un-map a field, click on the needed value and then press the delete key.

SmartConnect Mapping – Restrictions

The Line Restriction window allows scripting that can prevent a line of data from being sent through to the destination node. This restriction code will execute on each line of data or each line of grouped data, and if the code returns the value of “true” it will allow the data to be sent to the destination. If it returns “false” then that line of data will not be sent to the destination. The default value of a restriction is to “Return True” which would let every line of data process.

SmartConnect Mapping – Additional Columns

The Additional Columns window allows users to create new columns to transform, lookup, or process data before the values are sent to the destination. There are several standard additional column types that can be used on any integration, along with specific additional column types based on the destination selected.

Additional Columns

OK

Columns

Delete

	Name	Type
→	REMOVE_PHONE_FORMATTING	Calculation
	CUSTOM_NUMBER	Custom Rolling Column
	LOOKUP_STATUS	MSSQL Lookup

Additional Columns – MSSQL Lookup

The MSSQL Lookup uses a configured SQL Connection to lookup a value from within that server.

Available on: All Connectors

Lookup Name	The name to identify the SQL lookup, cannot be changed once set.
Connection	Drop-down to select an existing SQL Connection. The SQL connection must be created prior to setting up the SQL Lookup.
Server Name	Read-only value of the SQL server name pulled from the configured SQL Connection.
Database	The list of available databases from the SQL Connection, clicking the Refresh button will load in the currently accessible databases.
Table	The list of available tables from the selected database. If multiple tables must be joined together to get the necessary fields into one query, the Modify button can be used to open a query builder window.
Return Value	The field that should be returned from the table if there is a match on the criteria.
If No Data	The action to take if data is not found based on the criteria setup.
Default Value	Only applicable if 'Return default value' is selected for the field above. Allows the user to define the default value to be returned.
Lookup Criteria	One or more criteria fields can be setup to filter and compare to the lookup table. Source fields or other additional columns can be used to compare against the table fields.

The screenshot shows the 'Microsoft SQL Lookup Column' configuration window. It has a title bar with a refresh icon and a close button. Below the title bar are 'OK' and 'Cancel' buttons. The main area contains several fields: 'Lookup Name' (text box with 'LOOKUP_STATUS'), 'Connection' (dropdown with 'New SQL Connection'), 'Server Name' (text box with 'hansel-laptop\sqlexpress'), 'Database' (dropdown with 'test_registration' and a 'Refresh' button), 'Table' (dropdown with 'Setup' and a 'Modify' button), 'Return Value' (dropdown with 'RegistrationDate'), 'If No Data' (dropdown with 'Return failure for current integration line'), and 'Default Value' (empty text box). At the bottom is a 'Lookup Criteria' section with a table. The table has columns for 'Source', 'Operator', and 'Target'. A single row is visible with 'CustomerID' as the source, 'Equal To' as the operator, and 'SetupId' as the target. There are '+' and '-' buttons to the right of the table header.

	Source	Operator	Target
→	CustomerID	Equal To	SetupId

Additional Columns – Custom Rolling Column

The Rolling Column window allows for the creation of a custom next number generator within an integration. The number configured on this window will increment per record and will be stored from one integration run to the next. This number is not shared across integrations, if that functionality is required then the global rolling column should be used.

Available on: All Connectors

Name	The name to identify the Rolling Column, cannot be changed once set.
Next Number	<p>The incrementing value to be initially used by the custom rolling column. This will also display the current value of the next number.</p> <p>It is important to leave room for the number to “roll over” as it increments. The total length of the value will never change so 0’s have to be left within the number to allow it to increment. For example, the value IMPORT0099 will generate the next number of IMPORT0100 the next time a record is processed.</p>
Use for Global Variable	If this option is marked, the global variable GlobalRollingColumn will be assigned the value that is used for the record.

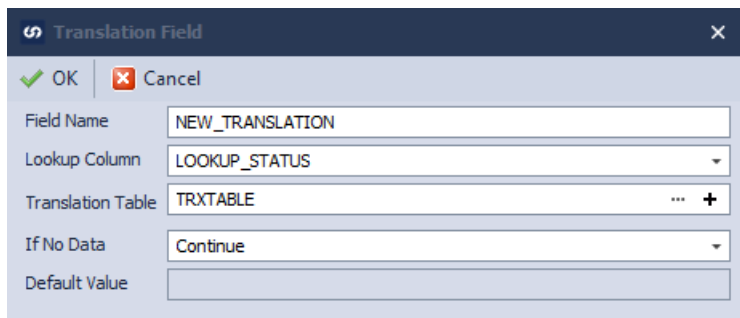

The screenshot shows a dialog box titled "Rolling Column" with a close button (X) in the top right corner. Below the title bar, there are two buttons: "OK" with a green checkmark icon and "Cancel" with a red X icon. The main area of the dialog contains three fields: "Name" with the text "CUSTOM_NUMBER", "Next Number" with the text "SCINTEGRATION0001", and "Use for Global Variable" with an unchecked checkbox.

Additional Columns – Translation

The Translation column uses a predefined translation table to convert a source column to a new value. Additional translation tables can be created in this window by clicking (+), or by navigating to File > Maintenance > Translation Tables

Available on: All Connectors

Field Name	The name to identify the Translation field, cannot be changed once set.
Lookup Column	The Source Column that will be translated
Translation Table	The predefined translation table that defines the value translations
If No Data	The action to take if data is not found based on the criteria setup
Default Value	Only applicable if 'Return default value' is selected for the field above. Allows the user to define the default value to be returned.

The screenshot shows a 'Translation Field' configuration window. It has a title bar with a gear icon and a close button. Below the title bar are 'OK' and 'Cancel' buttons. The form contains five fields: 'Field Name' with the value 'NEW_TRANSLATION', 'Lookup Column' with a dropdown menu showing 'LOOKUP_STATUS', 'Translation Table' with the value 'TRXTABLE' and a '+ ' button to the right, 'If No Data' with a dropdown menu showing 'Continue', and 'Default Value' with an empty text box.

Translation Field	
OK Cancel	
Field Name	NEW_TRANSLATION
Lookup Column	LOOKUP_STATUS
Translation Table	TRXTABLE ... +
If No Data	Continue
Default Value	

Additional Columns – Calculated

A calculated column runs a VB.NET or C# script based on an input of values and outputs the value for mapping to a destination field.

Available on: All Connectors

Validate	Validate the script syntax
Clear	Reset the script back to return ""
Name	The name to identify the calculated field, cannot be changed once set.
Fields	Available helpers to use in the script
Script Code	Free text field to write the script

Create new calculation

OK Cancel Validate Clear

Name: NEW_CALC

Fields

- Source Columns
 - _ADDRESSNAME
 - _ADDRESSSTREET1
 - _ADDRESSSTREET2
 - _CITY
 - _CUSTOMERID
 - _CUSTOMERNAME
 - _PHONE
 - _POSTALCODE
 - _STATE
- Functions
- Global Variables
- Helpers
- Default Connections
- Additional Columns

Calculation

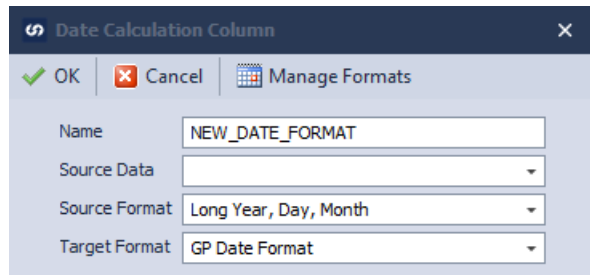

```
return _ADDRESSSTREET1 & " " & _ADDRESSSTREET2
```

Additional Columns – Date Column

A Date Column takes a source field in a specified format and outputs the date in a different specified format.

Available on: All Connectors

Name	The name to identify the Date Calculation field, cannot be changed once set.
Source Data	Source column containing the date to format
Source Format	The format of the 'Source Data' date column
Target Format	The desired date format for the field to output

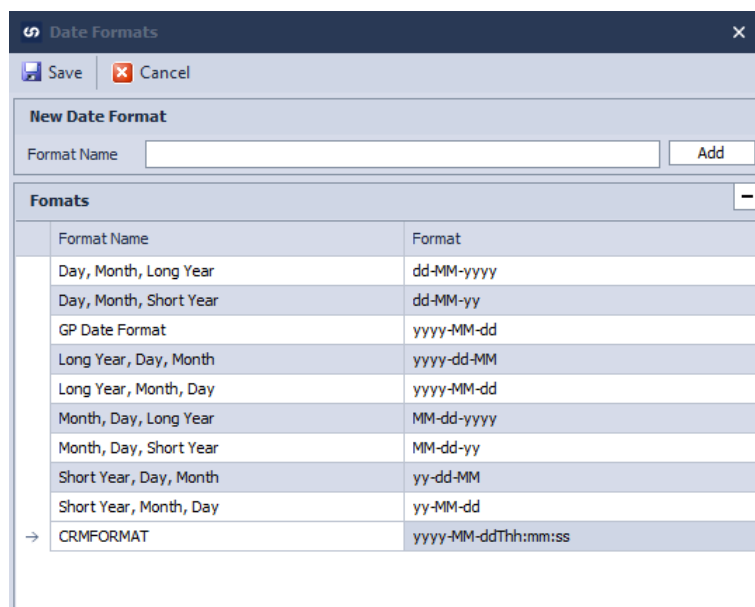

Date Calculation Column – Manage Formats

A list of date formats in SmartConnect using standard .NET formatting.

For more information see the official [Microsoft documentation](#).

Available on: All Connectors

Format Name	A friendly name to identify the format
Format	The technical .NET formatting string

Format Name	Format
Day, Month, Long Year	dd-MM-yyyy
Day, Month, Short Year	dd-MM-yy
GP Date Format	yyyy-MM-dd
Long Year, Day, Month	yyyy-dd-MM
Long Year, Month, Day	yyyy-MM-dd
Month, Day, Long Year	MM-dd-yyyy
Month, Day, Short Year	MM-dd-yy
Short Year, Day, Month	yy-dd-MM
Short Year, Month, Day	yy-MM-dd
→ CRMFORMAT	yyyy-MM-ddThh:mm:ss

Additional Columns – Odata Field Lookup

The Odata field Lookup uses published Business Central web service to retrieve a value based on a defined criterion.

Available on: Business Central Odata, NAV Odata

Name	The name to identify the Odata Field lookup, cannot be changed once set.
Service Name	The Business Central web service to use for the lookup
Return Value	Select the field from the lookup response that will be mapped to the destination
If No Data	The action to take if data is not found based on the criteria setup
Default Value	Only applicable if 'Return default value' is selected for the field above. Allows the user to define the default value to be returned.
Filter Fields	One or more criteria fields can be setup to filter and compare to the lookup service. Source fields or other additional columns can be used to compare against the table fields.

The screenshot shows the 'NAV Odata Field Lookup' configuration window. It has a title bar with a gear icon and standard window controls. Below the title bar are 'OK' and 'Cancel' buttons. The main area contains several input fields: 'Name' (text box with 'ODATA_LOOKUP_CODE'), 'Service Name' (text box with 'CustomerShipToAddress'), 'Return Value' (dropdown menu with 'Code' selected), 'If No Data' (dropdown menu with 'Continue' selected), and 'Default Value' (empty text box). At the bottom is a 'Filter Fields' section with a table. The table has columns 'Field', 'Field Type', and 'Criteria'. There is a '+' and '-' button to the right of the table header. One row is present with 'Customer_No' in the 'Field' column, 'Source Column' in the 'Field Type' column, and 'CustomerID' in the 'Criteria' column. A right-pointing arrow is to the left of the first row.

Field	Field Type	Criteria
→ Customer_No	Source Column	CustomerID

Additional Columns – Page Field Lookup

The Page field Lookup uses published Business Central soap page to retrieve a value based on a defined criterion.

Available on: Business Central Soap, NAV Soap

Name	The name to identify the Page Field lookup, cannot be changed once set.
Service Name	The Business Central web service page to use for the lookup
Service Url	Read-only field showing the field the web service Url used by the lookup
Return Value	Select the field from the lookup response that will be mapped to the destination
Filter Fields	One or more criteria fields can be setup to filter and compare to the lookup service. Source fields or other additional columns can be used to compare against the table fields.

Return Value: Code

Filter Fields

Field	Field Type	Criteria
Customer_No	Source Column	CustomerID

Additional Columns – Page Key Lookup

The Page key Lookup uses published Business Central soap page to retrieve a unique key for a record. These keys can be used for advanced actions such as deleting.

Available on: Business Central Soap, NAV Soap

Name	The name to identify the Page Key lookup field, cannot be changed once set.
Service Name	The Business Central web service page to use for the lookup
Service Url	Read-only field showing the field the web service Url used by the lookup
Filter Fields	One or more criteria fields can be setup to filter and compare to the lookup service. Source fields or other additional columns can be used to compare against the table fields.

Customer_No	Source Column	CustomerID

Additional Columns – Activity Party

An Activity Party in Dynamics CRM represents a person or group associated with an activity. This column type may be used to facilitate linking entities within Dynamics CRM to the required groups / people.

Available on: CE, CRM

Name	The name to identify the Activity Party field, cannot be changed once set.
Party Members	Select the type of entity to be linked (The entity name may be selected or contained within a source column). Select the source column that contains the entity reference to be linked. Add extra member party rows if required.

Activity Party Column

OK Cancel

Name: NEW_ACTIVITY_PARTY

Party Members + -

Entity Type	Column Data
→ Contact	Email

Additional Columns – List Option Lookup

A List Option Lookup column may be used to link data within a SmartConnect data source with the applicable option list value within Dynamics CRM.

Available on: CE, CRM

Name	The name to identify the List Option Lookup, cannot be changed once set.
Find Entity	Entity that contains the list option.
Picklist	Select the required list of options.
Column Names	Select the source column that contains the data to be looked up within Dynamics CRM.
If No Data	The action to take if data is not found based on the criteria setup
Default Value	Only applicable if 'Return default value' is selected for the field above. Allows the user to define the default value to be returned.

The screenshot shows a configuration window titled "List Option Lookup Column" with a close button (X) in the top right corner. At the top left, there are "OK" and "Cancel" buttons. The main area contains several labeled input fields:

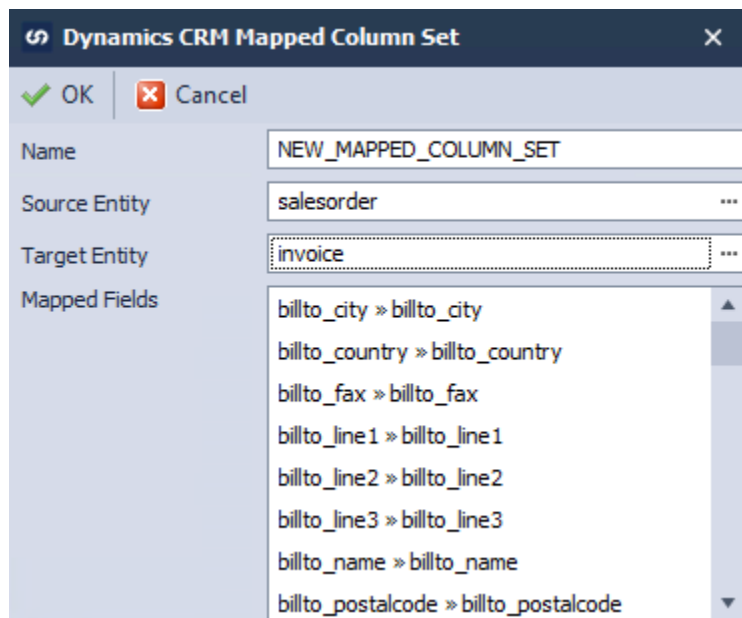

- Name:** A text box containing "NEW_LISTOPTION_LOOKUP".
- Find Entity:** A text box containing "account" with a three-dot menu icon on the right.
- Picklist:** A text box containing "customertypecode" with a three-dot menu icon on the right.
- Column Names:** A text box containing "CUSTTYPE" with a three-dot menu icon on the right.
- If No Data:** A dropdown menu with "Continue" selected.
- Default Value:** An empty text box.

Additional Columns – Mapped Column Set

A mapped column set allows related fields from the source entity to be integrated to the target entity.

Available on: CE, CRM

Name	The name to identify the Mapped Column Set field, cannot be changed once set.
Source Entity	Select the source entity that is to be processed.
Target Entity	Select the target entity for processing.
Mapped Fields	The fields mapped between the two entities should now appear in the mapped fields window.

The screenshot shows the 'Dynamics CRM Mapped Column Set' dialog box. It has a title bar with a refresh icon, the text 'Dynamics CRM Mapped Column Set', and a close button. Below the title bar are 'OK' and 'Cancel' buttons. The dialog contains four sections: 'Name' with a text box containing 'NEW_MAPPED_COLUMN_SET'; 'Source Entity' with a dropdown menu showing 'salesorder'; 'Target Entity' with a dropdown menu showing 'invoice'; and 'Mapped Fields' with a list box containing eight field mappings: 'billto_city » billto_city', 'billto_country » billto_country', 'billto_fax » billto_fax', 'billto_line1 » billto_line1', 'billto_line2 » billto_line2', 'billto_line3 » billto_line3', 'billto_name » billto_name', and 'billto_postalcode » billto_postalcode'.

Dynamics CRM Mapped Column Set

Name	NEW_MAPPED_COLUMN_SET
Source Entity	salesorder
Target Entity	invoice
Mapped Fields	billto_city » billto_city billto_country » billto_country billto_fax » billto_fax billto_line1 » billto_line1 billto_line2 » billto_line2 billto_line3 » billto_line3 billto_name » billto_name billto_postalcode » billto_postalcode

Additional Columns – Column Set

A column set will take data from the source entity, and process it, creating a record of the target type. The column set column defines the list of columns that should be passed to the target record from the source record.

Available on: CE, CRM

Name	The name to identify the Column Set field, cannot be changed once set.
Entity	Select the entity type that should be linked to the column set column.
Field List	Select the fields that should be passed to the target object.

Column Set

Select All Clear All

Additional Columns – Entity Lookup

A List Option Lookup column may be used to link data within a SmartConnect data source with the applicable option list value within Dynamics CRM.

Available on: CE, CRM, Salesforce

Name	The name to identify the Entity Lookup, cannot be changed once set.
Find Entity	Entity that contains the records.
If No Data	The action to take if data is not found based on the criteria setup
Default Value	Only applicable if 'Return default value' is selected for the field above. Allows the user to define the default value to be returned.
Where Fields	One or more criteria fields can be setup to filter and compare to the lookup entity. Source fields or other additional columns can be used to compare against the entity fields.

The image shows a configuration window titled "Entity Lookup Column". At the top, there are "OK" and "Cancel" buttons. Below them are four input fields: "Name" with the value "NEW_ENTITY_LOOKUP", "Find Entity" with the value "contact", "If No Data" with a dropdown menu showing "Continue", and "Default Value" which is empty. Below these fields is a section titled "Where" with a "+" and "-" button. Inside the "Where" section is a table with two columns: "Entity Attribute" and "Column Name". The first row in the table shows "emailaddress1" in the "Entity Attribute" column and "Email" in the "Column Name" column, with an equals sign between them. The "Email" value is shown in a dropdown menu.

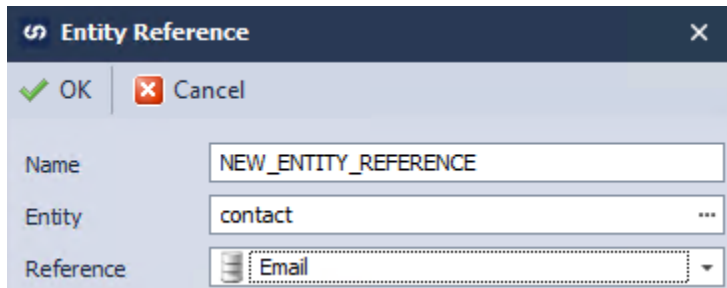

Entity Lookup Column	
OK Cancel	
Name	NEW_ENTITY_LOOKUP
Find Entity	contact
If No Data	Continue
Default Value	
Where + -	
Entity Attribute	= Column Name
→ emailaddress1	= Email

Additional Columns – Entity Reference

When linking records in CRM, if the id (GUID) of the record to be linked to is known, an entity reference column may be used to create the link between the current record and the target record. This removes the need to use an entity lookup to find the record to link to in CRM.

Available on: CE, CRM

Name	The name to identify the Entity Reference, cannot be changed once set.
Entity	Select the entity that the reference is for.
Reference	Select the column that holds the GUID for the entity reference.

The image shows a dialog box titled "Entity Reference" with a close button (X) in the top right corner. Below the title bar, there are two buttons: "OK" with a green checkmark icon and "Cancel" with a red X icon. The dialog contains three labeled input fields: "Name" with the text "NEW_ENTITY_REFERENCE", "Entity" with the text "contact" and a three-dot menu icon to its right, and "Reference" with a database cylinder icon and the text "Email" and a downward arrow icon to its right.

Additional Columns – Label

When updating meta type data within CRM a label column must be used for description fields. This allows descriptions / name fields to be displayed in multiple languages depending on system requirements.

Available on: CE, CRM

Name	The name to identify the CRM Label, cannot be changed once set.
Label Text	Select the data source field that holds the label text.
Language	Select the field that holds the label language or select the language from the list of languages from within CRM.

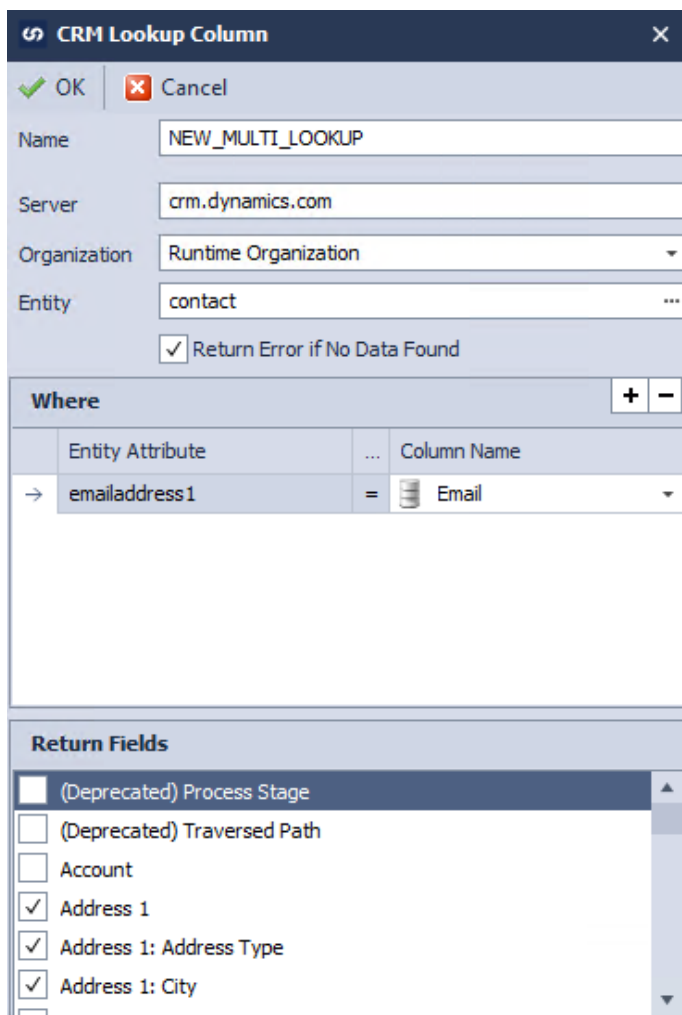

The screenshot shows a dialog box titled "CRM Label" with a close button (X) in the top right corner. Below the title bar, there are "OK" and "Cancel" buttons. The dialog contains three fields: "Name" with the text "NEW_LABEL", "Label Text" with a dropdown menu showing "Email", and "Language" with a dropdown menu showing "(1033) English (United States)".

Additional Columns – Multi Lookup

Sometimes when loading data into CRM information that should be included in the created record(s) exists in CRM but does not exist in the data source, a CRM lookup column may be used to query CRM with user definable criteria and return multiple columns which may then be used when mapping to the CRM destination. e.g. When creating address information for a contact, address may be read from the linked account and written to the contact record.

Available on: CE, CRM

Name	The name to identify the Multi lookup field, cannot be changed once set.
Server	Read only field showing what server/region the lookup is using.
Organization	Select the CRM organization that this lookup should always run against or select Runtime Organization to perform the lookup against the destination organization.
Entity	Select the entity to perform the lookup against.
Where	Select the entity fields and source fields to match.
Return Fields	Mark which fields will be returned from the lookup.

The image shows a 'CRM Lookup Column' dialog box. It has a title bar with a back arrow and a close button. Below the title bar are 'OK' and 'Cancel' buttons. The main area contains several fields: 'Name' (NEW_MULTI_LOOKUP), 'Server' (crm.dynamics.com), 'Organization' (Runtime Organization), and 'Entity' (contact). There is a checkbox for 'Return Error if No Data Found' which is checked. Below these is a 'Where' section with a table for defining criteria. The table has two columns: 'Entity Attribute' and 'Column Name'. One row is defined: 'emailaddress1' equals 'Email'. At the bottom is a 'Return Fields' section with a list of fields and checkboxes. The fields are: '(Deprecated) Process Stage', '(Deprecated) Traversed Path', 'Account', 'Address 1', 'Address 1: Address Type', and 'Address 1: City'. The checkboxes for 'Address 1', 'Address 1: Address Type', and 'Address 1: City' are checked.

Where	
Entity Attribute	Column Name
emailaddress1	Email

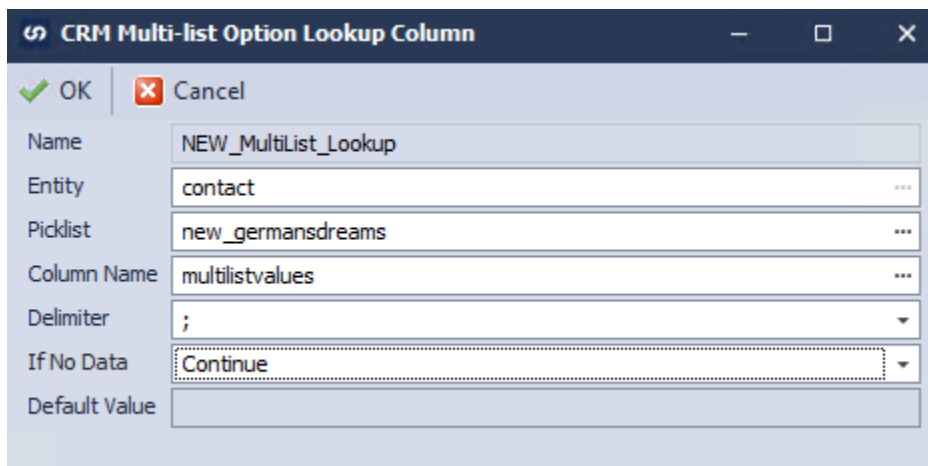

Return Fields	
<input type="checkbox"/>	(Deprecated) Process Stage
<input type="checkbox"/>	(Deprecated) Traversed Path
<input type="checkbox"/>	Account
<input checked="" type="checkbox"/>	Address 1
<input checked="" type="checkbox"/>	Address 1: Address Type
<input checked="" type="checkbox"/>	Address 1: City

Additional Columns – MultiList Option Lookup

A MultiList Option Lookup allows you to set multiple values in a CRM picklist from a source field that contains the available values within the CRM list.

Available on: CE, CRM

Name	The name to identify the Multi lookup field, cannot be changed once set.
Entity	Entity that contains the multi list option field.
Picklist	Select the picklist.
Column Name	Select the source fields that contain the list values separated by the delimiter specified below.
Delimiter	Select delimiter used in the source field. Can be a colon, semi colon, or a comma.
If No Data	The action to take if data is not found based on the criteria setup.
Default Value	Only applicable if 'Return default value' is selected for the field above. Allows the user to define the default value to be returned.

The screenshot shows a dialog box titled "CRM Multi-list Option Lookup Column". It has a dark blue header bar with a back arrow icon, a minus icon, a maximize icon, and a close icon. Below the header, there are two buttons: "OK" with a green checkmark icon and "Cancel" with a red X icon. The main area of the dialog contains several input fields with labels on the left:

- Name:** A text box containing "NEW_MultiList_Lookup".
- Entity:** A dropdown menu showing "contact".
- Picklist:** A dropdown menu showing "new_germansdreams".
- Column Name:** A text box containing "multilistvalues".
- Delimiter:** A dropdown menu showing ";".
- If No Data:** A dropdown menu showing "Continue".
- Default Value:** An empty text box.

Additional Columns – Relationship

A relationship column in CRM is used to define which relationship should be used with linking records together. e.g. When making a contact the primary contact for an account the account_primary_contact relationship should be used.

Name	The name to identify the Relationship field, cannot be changed once set.
Entity	Select the entity that represents the source side of the relationship.
Relationship	Select the required relationship from the list read from the previously selected entity.

Relationship Column

OK Cancel

Name: NEW_RELATIONSHIP

Entity: contact

Relationship: account_primary_contact

Additional Columns – REST Lookup

Integration Process – Options

The options tab of the integration allows users to configure settings for the integration.

Tasks – Process Stages

Allow any user to run this integration	Allows any user to run the integration without grant them access individually; enables running the integration through the SmartConnect web service
Owner	Set the owner of the integration
Integration Group	Assign the integration to an Integration Group as defined in Integrations > Integration Group
Concatenation Delimiter	Select the delimiter used if the aggregation for a destination field is set to 'Concat'
Return map success	If the data source returns no rows the process will end successfully
Return map failure	If the data source returns no rows the process will end with a failure
If there are blank lines in the data source	Define how blank lines should be processed, available options: Do Nothing, Exclude Blank Lines and Exclude Blank Keys
Use Log	Enables the additional logging options below, but does not do any logging without a specific log type also enabled
Log Errors	Specify if unsuccessfully processed documents should be written to the 'Map Log'
Log Error Source Data	Specify if source data and error messages for failed documents should be stored in 'Process Errors' for reprocessing
Log Successes	Specify if successfully processed documents should be written to the 'Map Log'
Log Xml	Specify if XML that would be written to the destination is also written to the directory in File > Maintenance > Setup
Process Errors	Specify if process errors should be output to a file in the directory defined in File > Maintenance > Setup
Script Language	Specify the scripting language for the integration

Integration Process – Tasks

Tasks are operations that occur at different stages in the integration process.

Tasks – Process Stages

Tasks that run before the Integration	These tasks will be executed before the data is read from the data source
Integration Data Checks	These tasks are executed after data is read from the data source, before processing documents
Tasks that run before the document	These tasks are executed before each document as defined by the 'Data Source Keys'
Tasks that run if the document fails	These tasks are executed after a document, as defined by the 'Data Source Keys', fails to import to the destination
Tasks that run if the document succeeds	These tasks are executed after a document, as defined by the 'Data Source Keys', successfully imports to the destination
Tasks that run if the Integration fails	These tasks will execute if any documents or tasks fail
Tasks that run if the Integration succeeds	These tasks will execute if all documents and tasks succeed

Tasks – New Task

New tasks can be created by right clicking on the process stage where the task will be added. Then select the task type desired.

Tasks – Type - Copy File

Copy file tasks will copy a file from a local file directory to another location.

Task Name	Unique name for the integration task.
Enabled	If selected, the task will be processed at runtime.
On Failure	Action performed if task fails. Options: Quit, Go to next step and Cancel Processing.
On Success	Action performed if task succeeds. Options: Quit, Go to next step and Cancel Processing.
Overwrite file	If selected, existing files with the same name will be overwritten.
Append date/time	If selected, the current date and time will be appended to the new file name.
Copy file	The location of the file to be copied.
To	The location where the new copy of the file will be created.
Sequence	Arrow keys can be used to modify process order of tasks on the same process stage.

Tasks – Type – SQL Validation

Determine if source data is valid against a SQL table. This task type can only be used on the 'Integration Data Checks' process stage.

*There is a prerequisite to setup at least one Microsoft SQL connection first.

Task Name	Unique name for the integration task.
Connection	The MSSQL connection to be used by the task.
Server	Read-only field displaying server used by the connection.
Database	Select the database on the server to be used by the command.
Table	Select the table to be evaluated.
Valid if	Select if validation is successful by data existing or not existing.
Modify	Modify opens a query editor window for creating advanced queries.
Enable	If selected, the task will be processed at runtime.
On Failure	Action performed if task fails. Options: Quit, Go to next step and Cancel Processing.
On Success	Action performed if task succeeds. Options: Quit, Go to next step and Cancel Processing.
Criteria	Specified criteria that must be met for validation.

→ GBL_DEFAULTEMAIL	

Variables – Map Variable

Map variables can be used in the integration scripts and sources.

Name	The unique name of the global variable.
Value	The value this integration will use for the variable.
Persist Run Value	When checked, the current value in memory at the end of the map run will overwrite the 'Value' field and be used on the next run.
Select at Runtime	When checked, at runtime the user will be asked to provide a value for the variable.
Runtime Prompt	When 'Select at Runtime' is checked, a prompt description can be provided when the user is asked to provide a value at runtime.

The image shows a 'Map Variable' dialog box with a dark blue header bar containing the title 'Map Variable' and a close button (X). The dialog has a light blue background. It contains five fields: 'Name' with the text 'GBL_DEFAULTEMAIL', 'Value' with the text 'support@eonesolutions.com', 'Persist Run Value' with an unchecked checkbox, 'Select at Runtime' with an unchecked checkbox, and 'Runtime Prompt' with an empty text box. At the bottom right, there are two buttons: 'OK' and 'Cancel'.

Name	GBL_DEFAULTEMAIL

Select at Runtime	<input type="checkbox"/>
Runtime Prompt	

OK Cancel

Integration Process – Schedule

SmartConnect maps can be scheduled to run automatically. Schedules require the SmartConnect Windows service to be installed on at least one server.

Schedule Task	The type of schedule to set. Options are: Daily, Weekly, Monthly and Once.
Start Time	The time on the local server to run the integration.
Every	Repeat the schedule every 'x' number of periods.
Repeat every	When checked, the integration can repeat every 'x' number of minutes.
For the duration of	Set the duration of the 'Repeat every' option.
End Time	Set the end time of the 'Repeat every' option.

Repeat

☒ Repeat every: 60 minutes

☐ For the duration of: 720 minutes

☐ End Time: 8:00:00 PM

Integrations – Navigation – Open

Allows users to open and edit integrations.

Integrations – Navigation – Delete

Allows users to delete an existing integration.

Delete data source	Check this box to also delete the associated data source when deleting this integration.
---------------------------	--

Integrations – Navigation – Refresh

Refresh the integration list to show any updates caused by integrations that were ran, modified, or deleted since the window was loaded.

Integrations – Integration – Integrations

Navigate to the integration list. This option only functions if user is currently on the 'Schedules' view.

Integrations – Integration – Run Integration

Runs the highlighted integration. This option is unavailable for real-time data sources. The following options are only available if at least one of the following criteria are met.

- Source is a file, and the 'Select File at Runtime' box is checked.
- The integration has a map variable with the 'Select at Runtime' box checked.

Connection	The unique name of the global variable
Select File	The value this integration will use for the variable
File Version	When checked, the current value in memory at the end of the map run will overwrite the 'Value' field and be used on the next run.
Select Sheet	When checked, at runtime the user will be asked to provide a value for the variable
Set Variables – Name	The unique name of the global variable
Set Variables – Prompt	A prompt description about the variable
Set Variables – Default Value	An editable field to set the default value for the global variable

New Datasource Name: New Excel File - COPY

Integrations – Integration Maintenance – Schedules

Shows a list of all configured schedules. 3 actions can be performed on this screen.

The screenshot shows the SmartConnect application interface. The top menu bar includes File, Connections, Data Sources, Integrations (selected), Maintenance, and Security. Below the menu is a toolbar with icons for Create, Open, Delete, Refresh, Integrations, Run Integration, Duplicate Integration, Schedules, Process Errors, Activity, Integration Group, Import, and Export. The main area is titled "Schedules" and contains a table with the following columns: Process Id, Next Run Date, Active, Last Run Success, Last Success Date, and Last Fail Date. The table lists three schedules: NEW_INTEGRATION_FROM_EXCEL, BULK_UPLOAD_MAP_1, and NEW_INTEGRATION_FROM_EXCEL_2. The status bar at the bottom shows Site Name: Two, Inc., User: chhanson.1@gmail.com, and Version: Perpetual.

Process Id	Next Run Date	Active	Last Run Success	Last Success Date	Last Fail Date
+ NEW_INTEGRATION_FROM_EXCEL	12/09/2021 12:00:00 PM	<input checked="" type="checkbox"/>	<input type="checkbox"/>		
+ BULK_UPLOAD_MAP_1	12/10/2021 08:00:00 AM	<input checked="" type="checkbox"/>	<input type="checkbox"/>		
+ NEW_INTEGRATION_FROM_EXCEL_2	12/10/2021 09:00:00 AM	<input type="checkbox"/>	<input type="checkbox"/>		

Schedules - Refresh

This will reload all the schedules and show updated run time and history.

Schedules - Expand schedule history

By clicking on the (+) next to the Process Id, a user can view the integration schedule history.

The screenshot shows the SmartConnect application interface with the "Schedules" section expanded. The table lists the schedule "CONTACT_DUMP" with a next run date of 08-24-2021 08:10:00 AM. Below the main table, the expanded history for "CONTACT_DUMP" is shown, including columns for Started, Ended, Records, Run Number, Success, Rescheduled, Next Run, Run Errors, and System Error. The history shows multiple successful runs from 08-24-2021 08:05:16 AM to 08-24-2021 07:15:16 AM.

Process Id	Next Run Date	Active	Last Run Success	Last Success Date	Last Fail Date

Integrations – Integration Maintenance – Process Errors

The Process Errors button displays integration errors ordered by run number by default.

The screenshot shows the 'Process Errors' window in the SmartConnect application. The window has a menu bar with 'File', 'Connections', 'Data Sources', 'Integrations', 'Maintenance', and 'Security'. Below the menu bar is a toolbar with icons for 'Create', 'Open', 'Delete', 'Refresh', 'Integrations', 'Run Integration', 'Duplicate Integration', 'Schedules', 'Process Errors', 'Activity', 'Integration Group', 'Import', and 'Export'. The 'Process Errors' button is highlighted in the toolbar.

The main area of the window is titled 'Process Errors' and contains a 'Re-Process' button. Below this is a search bar with 'Integration Id' and 'Run Number' dropdowns, and a 'Find' button. The search bar contains the text 'Enter text to search...'.

The table below shows the results of the search, displaying integration errors ordered by run number. The table has columns for 'Tenant Server Name', 'Tenant Name', 'Run Date', 'Run User', 'Run Type', and 'Error Count'.

Tenant Server Name	Tenant Name	Run Date	Run User	Run Type	Error Count
Integration Job: PROCSSEERRORS (Count=4)					
Run Number: 3					
sbates12019.centralus.cloudapp.azure.com	SecondaryTesting	12/10/2021 03:07:48 PM	jared.dux@eonesolutions.com	Setup	128
sbates12019.centralus.cloudapp.azure.com	ID_SC_Online	12/10/2021 03:07:48 PM	jared.dux@eonesolutions.com	Setup	128
Run Number: 4					
sbates12019.centralus.cloudapp.azure.com	SecondaryTesting	12/10/2021 03:08:42 PM	jared.dux@eonesolutions.com	Setup	128
sbates12019.centralus.cloudapp.azure.com	ID_SC_Online	12/10/2021 03:08:43 PM	jared.dux@eonesolutions.com	Setup	128

The status bar at the bottom of the window shows 'Site Name: eOne Demo', 'User: jared.dux@eonesolutions.com', and 'Version: 1.0.0'.

Process Errors – SmartConnect Process Errors

Double clicking a run number opens the specific errors for the run.

Save to File... Run Selected Tenant Delete All Delete Rows

SmartConnect Process Errors – Run Errors

Re-run the integration with the specific records that failed on the initial run.

Run All	Runs the error records to all tenants.
Disable Pre-Tasks for Re-Run	Re-runs the records without re-running any integration pre tasks.
Save to File	Saves the error to a local file on the machine.
Run Selected Tenant	Run the errors again using a selected tab.
Delete All	Removes all the error records for the current run number.
Delete Rows	Removes specific rows form the current run number.

The screenshot shows the 'SmartConnect Process Errors' application window. At the top, there are buttons for 'Save', 'Clear', 'Delete', and 'Run All'. Below these, the 'Integration' dropdown is set to 'PROCESSERRORS' and the 'Run Number' is '3'. The 'Description' field contains 'ProcessErrors'. A checkbox for 'Disable Pre-Tasks for Re-Run' is present. The main area displays a table of error records with columns: CUSTNMBR, CUSTNAME, CUSTCLAS, CPRCSTNM, CNTCPRS, STMTNAME, SHRTNAME, ADRSCODE, UPSZONE, and SHIPMTHD. A modal dialog box titled 'SmartConnect' is open in the center, asking 'Are you sure you would like to run the Integration for the selected tenant now?' with 'Yes' and 'No' buttons. The bottom of the window has buttons for 'Save to File...', 'Run Selected Tenant', 'Delete All', and 'Delete Rows'.

Integrations – Integration Maintenance – Integration Group

Create groups to help organize integrations and allow filtering on the main integration window by group name.

Integration Groups

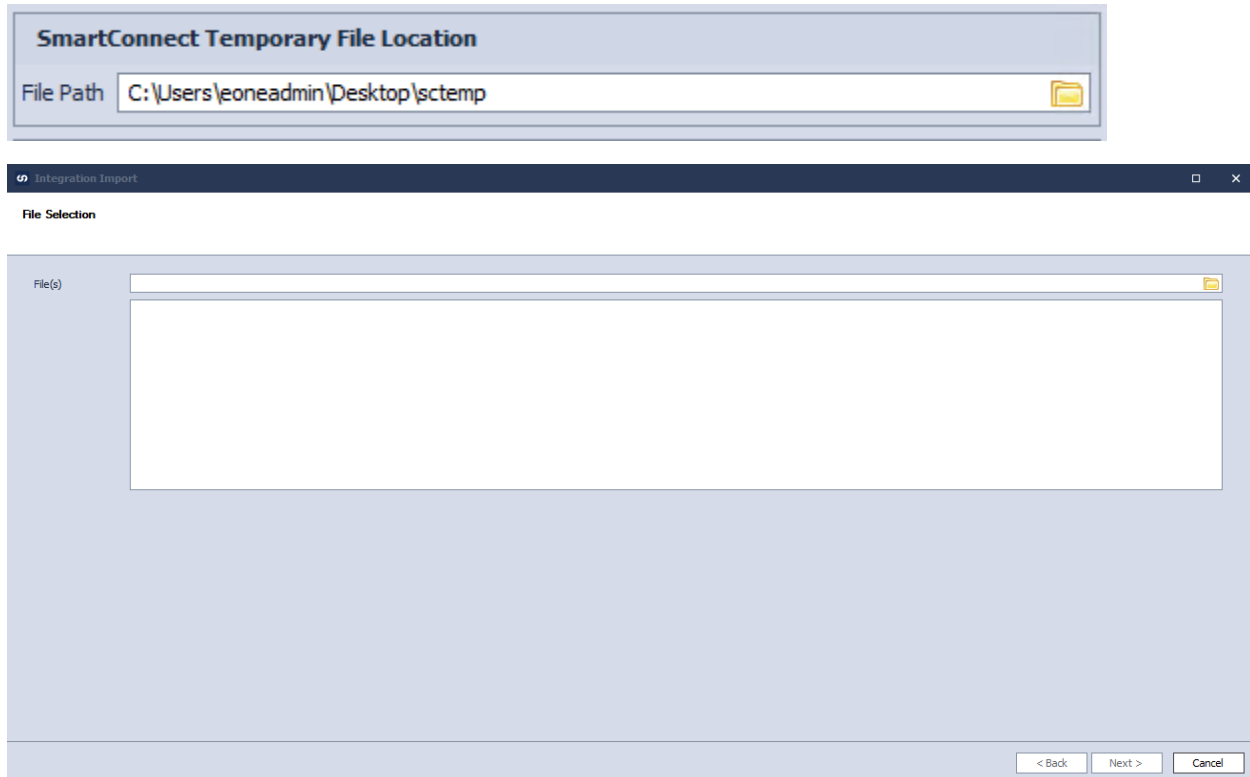

Create

Delete

	Group Name
→	Business Central
	GP
	Shopify

Integrations – Import/Export – Import

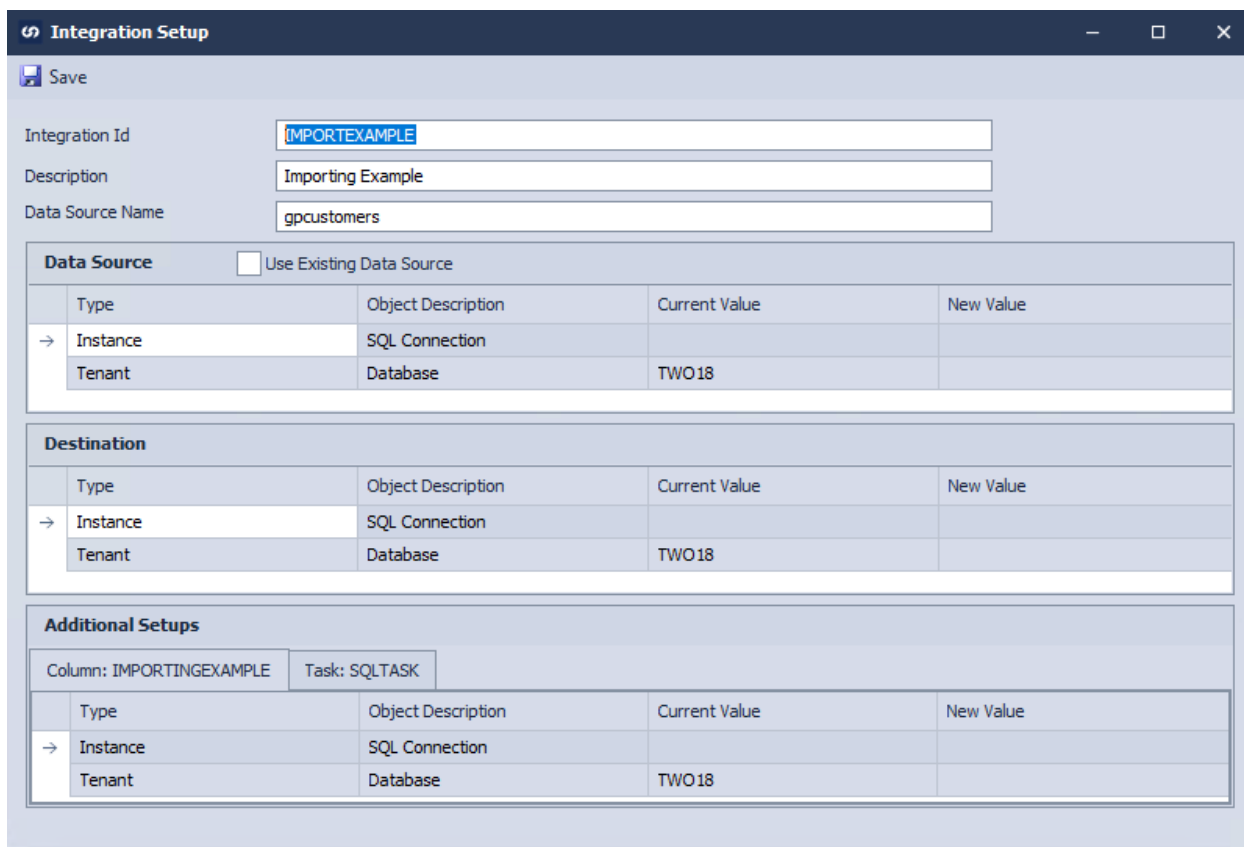

Import an integration from a zip file. A temporary file location must be set in File>>Maintenance>>Setup before any integrations can be imported.

Select the zip files for the integrations to be imported and click Next. The next window will be a summary of the integrations being imported. If you decide you do not need a specific integration unmark the import checkbox and then click Next.

This window will show which integrations are ready to be imported. You will not be able to click Next until all integrations are setup. A red X will appear for any integrations that need to be setup. Double click the integration row to enter the Integration Setup.

The screenshot shows the 'Integration Setup' window. At the top, there's a 'Save' button. Below it are three input fields: 'Integration Id' with the value 'IMPORTEXAMPLE', 'Description' with 'Importing Example', and 'Data Source Name' with 'gpcustomers'. There are three main sections: 'Data Source', 'Destination', and 'Additional Setups'. Each section has a table with columns: Type, Object Description, Current Value, and New Value. In the 'Data Source' section, the 'Use Existing Data Source' checkbox is unchecked. The 'Data Source' table has two rows: 'Instance' (SQL Connection) and 'Tenant' (Database, TWO18). The 'Destination' table also has two rows: 'Instance' (SQL Connection) and 'Tenant' (Database, TWO18). The 'Additional Setups' section has a sub-header 'Column: IMPORTINGEXAMPLE Task: SQLTASK' and a table with two rows: 'Instance' (SQL Connection) and 'Tenant' (Database, TWO18).

Integration Id	Set the Integration Id for the imported integration.
Description	Set the Integration Description for the imported integration.
Data Source Name	Set the Data Source Name if creating a new source.
Use Existing Data Source	Choose this checkbox if there is already a data source in SmartConnect you want to use.

Data Source – If you have checked Use Existing Data Source, select the existing data source by clicking the lookup button in the New Value column. If a new data source is being created, choose the connector and tenant in the New Value column.

Destination – Choose the connector and tenant in the New Value column.

Additional Setups – This section shows all additional connections used within an integration. Each additional setup will have its own tab that will need to be setup like the Data Source and Destination sections.

Once setup, click Save on the Integration Setup window and repeat the process if importing multiple integrations. Once all integrations have been setup click Next to process the integrations.

Integrations – Import/Export – Export

Export integrations to a zip file with all dependencies.

Set an export location and choose which map(s) are to be exported and then click the export button.

Maintenance

View a list of all REST Service definitions currently in the database.

*Note: REST Service Definitions do not count against your paid connection limit until they are added as a connection on the 'Connections' tab.

Name	A name for the service provider
Connection Count	Number of Connections currently using the definition
Service Type	Is User or System defined

The screenshot shows the 'Maintenance' tab in the SmartConnect application. The top navigation bar includes 'File', 'Connections', 'Data Sources', 'Integrations', 'Maintenance' (selected), and 'Security'. Below the navigation bar is a toolbar with icons for 'Create', 'Open', 'Delete', 'Refresh', 'Services', 'Import', 'Export', and 'Clone'. The main area displays a table titled 'Generic Rest Services' with columns for 'Name', 'Connection Count', and 'Service Type'. The table lists various REST service providers, including Autotask PSA, BigCommerce, BrightReps, HubSpot (4), Interworks, MediusConenctor, miniter, Procore, Shopify, and WooCommerce_1.0.0.0.

	Name	Connection Count	Service Type
→	Autotask PSA	1	User
	BigCommerce	1	User
	BrightReps	1	User
	HubSpot (4)	1	User
	Interworks	0	User
	MediusConenctor	0	User
	miniter	1	User
	Procore	1	User
	Shopify	1	User
	WooCommerce_1.0.0.0	1	User

Maintenance – Navigation – Create

Creates a new REST Service Definition. this will be generic definitions SmartConnect will use to interact with a REST based API. After the REST Service definition is created it will need to be added to the Connections tab in SmartConnect before it can be used.

Generic REST Service – Settings

General setup information for the REST Service.

Service Provider Name	A name for the service provider
Service Image	Upload a PNG or JPG image to help identify the service
Base Url	The part of the URL that will stay the same for all requests
Request Method	The default request method (can be modified on each individual request as needed)
Response Type	What format the responses from the REST service use
Body Type	What format will the body generated by SmartConnect use
Authentication Method	What authentication type does the REST service use
Date Format	What format will date fields from the REST service use
Custom Date Format	Specify a custom date format used by the REST Service

Generic REST Service – Install Notes

Configure an HTML document to help users configure this REST Connector.

Generic REST Service – OAuth Settings

This section is accessible and applies only when OAuth2 is selected as the Authentication Method on the Settings panel of the REST Service setup window.

Authorization Url	Url SmartConnect will use to retrieve an access code
Access Token Url	Url SmartConnect will use to retrieve an access token
Scope	OAuth Scopes required by SmartConnect
State	Always set this field to <serviceid>
Refresh Method	Set the method type used to refresh an expired token
Token Refresh Length	Set the life expectancy of a token
Token Refresh Units	Set the units used by the 'Token Refresh Units'
Refresh Token Url	Set the Refresh Token Url
Redirect Url	A read-only field showing the redirect Url to setup on the OAuth settings of the REST Service application

The OAuth Setup includes some standard variables that can be used to provide standard OAuth functionality. These variables should always be wrapped in <> example: <serviceid>

clientid	Client Id retrieved from the 3 rd part app
redirect	The SmartConnect app password to redirect the flow back to SmartConnect
scope	OAuth permissions SmartConnect Requires
state	A string value used to maintain the user's state when redirected back to SmartConnect after the auth flow
serviceid	Unique guid identifying your SmartConnect Connector

The screenshot shows the 'Generic Rest Service - HubSpot (4)' window with the 'OAuth Settings' tab selected. The fields are as follows:

Authorization Url	<input type="text" value="https://app.hubspot.com/oauth/authorize?client_id=<clientid>&redirect_uri=<redirect>&scope=<scope>&state=<state>"/>		
Access Token Url	<input type="text" value="https://api.hubapi.com/oauth/v1/token"/>		
Scope	<input type="text" value="contacts oauth integration-sync tickets e-commerce accounting"/>		
State	<input type="text" value="<serviceid>"/>		
Refresh Method	<input type="text" value="After Time Period Expires"/>		
Token Refresh Length	<input type="text" value="6"/>	Token Refresh Units	<input type="text" value="Hour"/>
Refresh Token Url	<input type="text" value="https://api.hubapi.com/oauth/v1/token"/>		
Redirect Url	<input type="text" value="https://login.smartconnect.com/OAuth/OAuthRedirect"/>		

Generic REST Service – Exchange Token

This section is accessible and applies only when Exchange Token is selected as the Authentication Method on the Settings panel of the REST Service setup window.

End Point	The Url endpoint to request a token
Request Method	The request method type
Body Type	The body data type Available options: JSON, XML, Text, Url Encoded Form
Body	Body to send to remote server
Token Response Path	Location of the access token in the body of the authentication response
Token Expires	Select frequency method to refresh token. Available options: Never, After Time Period, Before Request
Length	Length of time token expires
Units	Units of Token expiry length

The Exchange Token Setup includes two standard variables that users can set when configuring the connector. These variables should always be wrapped in [[]] example: [[Username]]

Username	Value the user provides for Username in the connector setup
Password	Value the user provides for Password in the connector setup

The screenshot shows the 'Generic Rest Service - MediusConenctor' window with the 'Exchange Token' tab selected. The 'Exchange Token Settings' section contains the following fields:

- End Point:** `https://cloud.mediusflow.com/eoneQA/api/connect/token`
- Request Method:** `Post`
- Body Type:** `Url Encoded Form`
- Body:** `grant_type=client_credentials&scope=Integration.Erp&client_id=[[Username]]&client_secret=[[Password]]`
- Token Response Path:** `access_token`
- Token Expires:** `After Time Period`
- Length:** `1`
- Units:** `Hour`

The token retrieved from this request will be saved to a variable named Token. This token can then be added to either a header or parameter as shown below.

The screenshot shows the 'Generic Rest Service - MediusConenctor' window with the 'Headers' tab selected. The 'Headers' section contains a table with the following data:

Name	Description	Value	Clear Empty
→ Authorization	Authorization Token	<code>Bearer [[Token]]</code>	<input type="checkbox"/>

Generic REST Service – Parameters

Parameters that will default on all API requests. If the parameter is not required for a particular endpoint, it can be disabled on that endpoint.

Name	The name of the parameter as outlined in the REST API documentation
Description	A friendly description for the parameter
Value	The value to be used by the parameter
Clear Empty	If selected, don't use the parameter if the Value is blank
Exclude in Paging	If selected, the parameter will not be used when requesting additional pages of data from sources

Generic REST Service – Paging

When reading large data sets it may be necessary for SmartConnect to make multiple requests to the web service to retrieve the full data set. Most modern APIs support paging, and SmartConnect can manage the most common implementations of paging.

*Note it is not required to provide a value for all fields in paging setup.

Paging Method – Custom

A simple method of paging which only expects two parameters.

Has More Pages Path	Where in the response the Has more Pages identifier can be found
Page Size	Maximum number of records to return per page

Generic Rest Service - Procure

Save Cancel

Settings Install Notes OAuth Settings Parameters Headers **Paging** Groups Data Sources Destinations Lookups Variables

Paging

Paging Method: Custom

Has More Pages Path: Link From response header

Page Size: 10000

Paging Method – Item Count

Paging method to use when response includes a count of total records

Page Offset Parameter	Name of the request parameter specifying offset index
Page Parameter	Name of the request parameter specifying the current page
Item Count Path	Where in the response the total item count can be found
Page Size Parameter	Name of the request parameter specifying page size
Page Size	Maximum number of records to return per page

Generic Rest Service - interworks

Save Cancel

Paging

Paging Method: Item Count

Page Offset Parameter: From response body

Page Parameter: page As request url parameter

Item Count Path: paging.totalCount From response body

Page Size Parameter: size As request url parameter

Page Size: 100

Paging Method – Next Page Link

Paging where the REST Service response includes a link for the next page.

Next Page Link Path	Path to the next page link in the response
Has More Pages Path	Where in the response the Has more Pages identifier can be found
Page Size Parameter	Name of the request parameter specifying page size
Page Size	Maximum number of records to return per page

The screenshot shows the 'Generic Rest Service - Shopify' configuration window with the 'Paging' tab selected. The 'Paging Method' is set to 'Next Page Link'. The 'Next Page Link Path' is 'Link', and the 'Has More Pages Path' is empty. The 'Page Size Parameter' is 'limit', and the 'Page Size' is '250'. The 'From response header' dropdown is set to 'From response header' and the 'As request url parameter' dropdown is set to 'As request url parameter'.

Paging Method – Next Page Number

Paging where you don't know how many pages there will be.

Has More Pages Path	Where in the response the Has more Pages identifier can be found
Page Parameter	Name of the request parameter specifying the current page
Page Size Parameter	Name of the request parameter specifying page size
Page Size	Maximum number of records to return per page

The screenshot shows the 'Generic Rest Service - WooCommerce_1.0.0.0' configuration window with the 'Paging' tab selected. The 'Paging Method' is set to 'Next Page Number'. The 'Has More Pages Path' is 'X-WP-TotalPages', and the 'Page Parameter' is 'page'. The 'Page Size Parameter' is 'per_page', and the 'Page Size' is '100'. The 'From response header' dropdown is set to 'From response header' and the 'As request url parameter' dropdown is set to 'As request url parameter'.

Paging Method – None

The connector will not page through large data sets.

Paging Method – Page Count

Paging where the REST service provides a page count.

Page Count Path	Where in the response the page count can be found
Has More Pages Path	Where in the response the Has more Pages identifier can be found
Page Parameter	Name of the request parameter specifying the current page
Page Size Parameter	Name of the request parameter specifying page size
Page Size	Maximum number of records to return per page

The screenshot shows the 'Generic Rest Service - BigCommerce' configuration window. The 'Paging' tab is selected. The configuration fields are as follows:

Paging Method	Page Count	
Page Count Path	meta.pagination.total_pages	From response body
Has More Pages Path		From response header
Page Parameter	page	As request url parameter
Page Size Parameter	limit	As request url parameter
Page Size	250	

Paging Method – Page Offset

Paging where the response includes an offset value

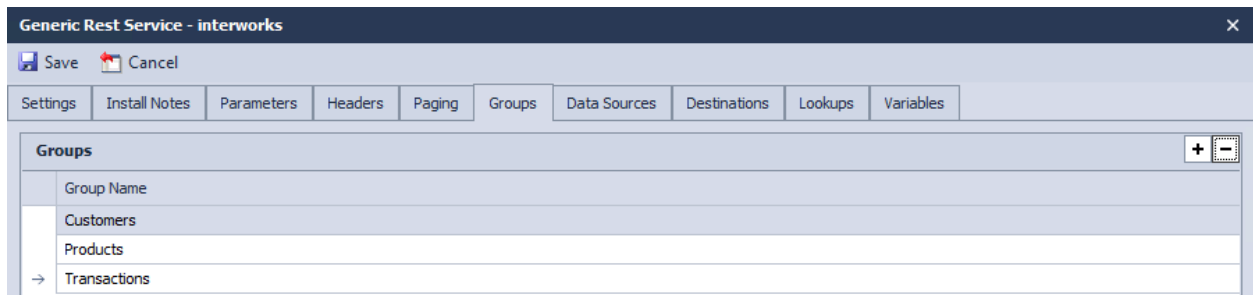

Page Offset Path	Where in the response the offset of the next page begins
Page Offset Parameter	Name of the request parameter specifying offset index
Has More Pages Path	Where in the response the Has more Pages identifier can be found
Page Size Parameter	Name of the request parameter specifying page size
Page Size	Maximum number of records to return per page

The screenshot shows the 'Generic Rest Service - HubSpot (4)' configuration window. The 'Paging' tab is selected. The configuration fields are as follows:

Paging Method	Page Offset	
Page Offset Path	paging.next.after	From response body
Page Offset Parameter	after	As request url parameter
Has More Pages Path	paging.next.after	From response body
Page Size Parameter	limit	As request url parameter
Page Size	100	

Generic REST Service – Groups

Optional groups that can be configured to organize data sources and destinations.

The screenshot displays the 'Generic Rest Service - interworks' configuration window. The 'Groups' tab is active, showing a table of configured groups. The table has a header row with 'Group Name' and a right-pointing arrow icon. The table contains three rows: 'Customers', 'Products', and 'Transactions'. The 'Transactions' row is highlighted, and a right-pointing arrow is visible in the left margin next to it.

Group Name
Customers
Products
→ Transactions

Generic REST Service – Data Sources

List of all Data Sources configured for the REST Service. New Sources can be created here and existing data sources can be modified or cloned.

Data Source Name	Friendly name to identify your data source

REST Data Source Maintenance – Entity Notes

Optional: Configure an HTML document to help users use this data source.

REST Data Source Maintenance – Fields

The Fields tab allows users to configure how SmartConnect will parse the body of the response from the REST Service.

Load From File	Load a sample JSON file of the expected response from the REST Service
Name	Friendly name for the data source field
Path	The technical path to the field. Each parent child relationship is defined by a period
Type	The data type of the field. Data type must match the API otherwise the field will appear blank when previewing
Calculated Fields	Section to configure custom calculations based on source fields (more below)

The screenshot shows a software window titled "Rest Data Source Maintenance - interworks : Incremental Accounts". At the top, there are "Save" and "Cancel" buttons. Below them is a tabbed interface with "Settings", "Entity Notes", "Fields", "Parameters", "Headers", and "Body". The "Fields" tab is active. It contains a "Load From File" button and a table with three columns: "Name", "Path", and "Type". The table lists five fields: "autoInvoiceNotification" (Boolean), "billingAddress address" (String), "billingAddress address2" (String), "billingAddress city" (String), and "billingAddress country code" (String). Below the table is a section for "Calculated Fields" with a table that has columns for "Name", "Type", and "Edit". The "Calculated Fields" table is currently empty.

Name	Path	Type
autoInvoiceNotification	data.autoInvoiceNotification	Boolean
billingAddress address	data.billingAddress.address	String
billingAddress address2	data.billingAddress.address2	String
billingAddress city	data.billingAddress.city	String
billingAddress country code	data.billingAddress.country.code	String

Name	Type	Edit
------	------	------

REST Data Source Maintenance – Fields - Calculated

Custom fields can be defined as part of the data source.

Field Name	A friendly name for the data source field
Field Type	The output data type of the calculation
Script	JavaScript script to calculate the output for the field
Insert Field	Insert a source field into the cursor location

Generic REST Service – Destinations

List of all Destinations configured for the REST Service. New Destinations can be created here, and existing destinations can be modified or cloned.

Destination Name	Friendly name to identify your destination.
Group Name	Group to organize requests.
Edit	Will open the edit destination window.
Clone	Will duplicate/clone the existing destination.

REST Destination Maintenance – Settings

Configure general settings for the destination.

Name	Friendly name to identify your destination
Linked Entity	Select a predefined data source to import source fields from
Group	Group to organize requests
Endpoint	The remainder of the Url after the Base Url
Request Method	The request method used
Clear Unmapped Values	If a field is not mapped in the integration, it will not be sent to the REST Service even if defined in the Body tab
Use Value Pairs	Specify if the body will be using value pairs. Required for 'Clear Unmapped Values' to function
Value Pair key	Specify the key in the value pair to help SmartConnect parse the body objects

REST Destination Maintenance – Child Entities

Child entities allow nested arrays to be generated by SmartConnect. Common use cases are order lines or addresses. A child entity can be nested in another child entity. If this is required, make sure the parent entity is always listed above the child.

Name	Technical name for the child entity
Description	Friendly description of child entity
Move Up	Move selected child entity up
Move Down	Move selected child entity down
Edit	Edit selected child entity

subtotal_tax	String	<input type="checkbox"/>	
total	String	<input type="checkbox"/>	▼

REST Action Child Entity – Template

Define the body layout based on the desired output. Fields will automatically be sent as the data type specified on the 'Fields' tab.

Body	A free text field to enter the body template
Validate	Validate body syntax is correct
Insert Child Entity	Insert a child entity to the cursor location
Insert Field	Insert a field to the cursor location

The screenshot shows a dialog box titled "Rest Action Child Entity" with a close button (X) in the top right corner. Below the title bar are "Save" and "Cancel" buttons. The dialog has three tabs: "Settings", "Fields", and "Template", with "Template" being the active tab. Inside the "Template" tab, there are three buttons: "Body", "Validate", and "Insert Child Entity", followed by a dropdown menu. Below these buttons is a large text area containing a JSON template:

```
{
  "name": <<name>>,
  "product_id": <<product_id>>,
  "variation_id": <<variation_id>>,
  "quantity": <<quantity>>,

Generic REST Service – Lookups

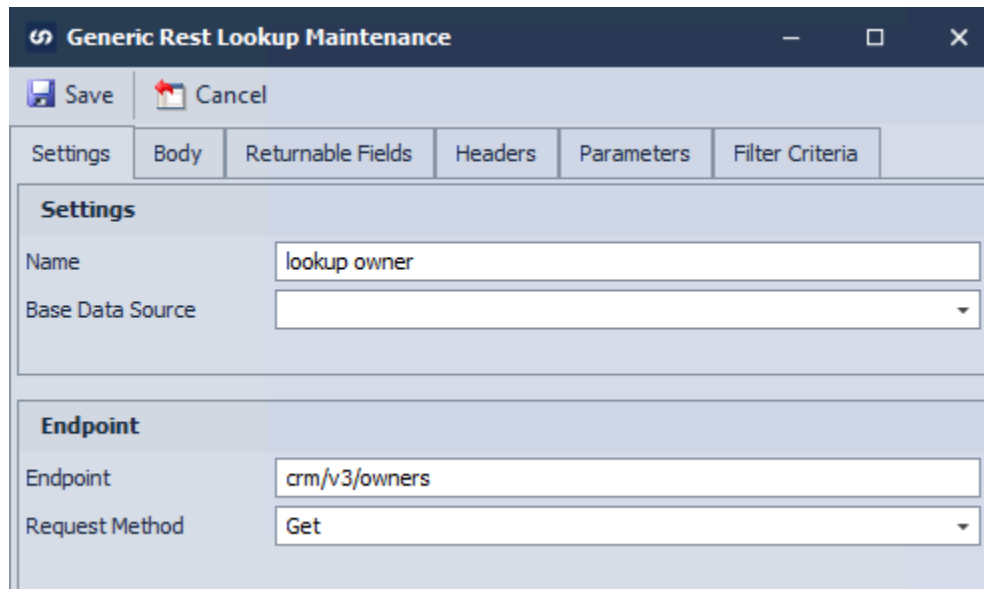

Define custom lookups allowing users to lookup records from the target REST Service based on source fields.

Destination Name	A friendly description for the lookup
Edit	Will open the edit lookup window
Clone	Will duplicate/clone the existing lookup

REST Lookup Maintenance – Settings

Name	A friendly description for the lookup
Base Data Source	If desired, import settings from an existing data source
Endpoint	The remainder of the Url after the Base Url
Request Method	The request method used

The image shows a software window titled "Generic Rest Lookup Maintenance". It has a dark blue header bar with a logo on the left and standard window controls (minimize, maximize, close) on the right. Below the header is a light blue bar containing "Save" and "Cancel" buttons. A tabbed interface follows, with tabs for "Settings", "Body", "Returnable Fields", "Headers", "Parameters", and "Filter Criteria". The "Settings" tab is active, showing two sections: "Settings" and "Endpoint". The "Settings" section has a "Name" text field with the value "lookup owner" and a "Base Data Source" dropdown menu. The "Endpoint" section has an "Endpoint" text field with the value "crm/v3/owners" and a "Request Method" dropdown menu with the value "Get".

REST Lookup Maintenance – Body

If the request requires a body, this can be defined here. If assigning a dynamic filter value to the body use a variable enclosed in double square brackets [[]] as shown below

Type	Select the data type of the body
Body	A free text field to enter the body template
Insert Field	Insert a field to the cursor location

The screenshot shows the 'Generic Rest Lookup Maintenance' dialog box with the 'Body' tab selected. The 'Type' dropdown is set to 'JSON'. The 'Body' text area contains a JSON template with a filter condition. The 'Insert Field' dropdown is empty. The JSON template is as follows:

```
{
  "filterGroups": [
    {
      "filters": [
        {
          "propertyName": "email",
          "operator": "EQ",
          "value": "[[email]]"
        }
      ]
    }
  ],
  "properties": [
    "id"
  ],
  "limit": 100,
  "after": 0
}
```

REST Lookup Maintenance – Returnable Fields

Name	A friendly name for the field
Path	The technical path to the field. Each parent child relationship is defined by a period
Type	The data type of the field as outlined in the REST API documentation

The screenshot shows a software window titled "Generic Rest Lookup Maintenance". It has a dark blue header bar with a back arrow icon, the title, and standard window controls (minimize, maximize, close). Below the header is a toolbar with "Save" and "Cancel" buttons. A tabbed interface follows, with tabs for "Settings", "Body", "Returnable Fields" (which is active), "Headers", "Parameters", and "Filter Criteria". The "Returnable Fields" tab contains a table with columns "Name", "Path", and "Type". A single row is visible with the values "id", "results.id", and "Integer". To the right of the table header is a "+ -" control. A right-pointing arrow is visible to the left of the first row.

	Name	Path	Type
→	id	results.id	Integer

REST Lookup Maintenance – Headers

Specify headers to send to this lookup.

Use Default Headers	If selected, default headers will be sent to this endpoint
Key	The name of the header as outlined in the REST API documentation
Description	A friendly description for the header
Value	The value to be used by the header
Clear Empty	If selected, don't use the header if the Value is blank

REST Lookup Maintenance – Parameters

Specify URL parameters to send to this lookup.

Use Default Parameters	If selected, default parameters will be sent to this endpoint
Key	The name of the parameter as outlined in the REST API documentation
Description	A friendly description for the parameter
Value	The value to be used by the parameter
Clear Empty	If selected, don't use the parameter if the Value is blank

The screenshot shows a software window titled "Generic Rest Lookup Maintenance". It has a dark blue header bar with standard window controls (minimize, maximize, close). Below the header is a toolbar with "Save" and "Cancel" buttons. A tabbed interface contains six tabs: "Settings", "Body", "Returnable Fields", "Headers", "Parameters", and "Filter Criteria". The "Parameters" tab is active. It features a section titled "Default Parameters" with a checkbox labeled "Use Default Parameters". Below this is a table with columns: "Key", "Description", "Value", and "Clear Empty". The "Parameters" section below has a "+" and "-" button on the right. It contains a table with the same columns. The first row has "email" in the "Key" column, "email" in the "Description" column, and an empty "Value" column. The "Clear Empty" checkbox for this row is checked. A right-pointing arrow is visible to the left of the "email" key.

REST Lookup Maintenance – Filter Criteria

Specify which variables, parameters, and headers will be provided to the user to use as the filter criteria when using the lookup in an integration.

Name	The name shown to the user in the integration setup
Display in Filter	If selected, the user will see this field as a filter criteria in integration setup
Clear Empty	Remove these Parameters and Headers if they are blank

Generic REST Service – Variables

Define variables in the context of this REST Connector. These variables can be used throughout the connector for specifying URL segments or the body in a REST Lookup.

Placeholder	Unique identifier for the variable
Description	A friendly description of the variable
Type	A helpful way to identify variables as System (set at connector level) or Runtime (set at endpoint level). Does not impact functionality.
Value	The default value for the variable
Required	If selected, variable is required on all endpoints

Generic Rest Service - WooCommerce_1.0.0.0 ×

User Setup – Details

Email	Email address of the user being added.
Password	The SmartConnect password set for the user.
Change Password at Login	If checked, the user will be asked to change their password when logging in for the first time. If not checked, the set password will remain.
Admin	If checked, the user will have Admin rights within SmartConnect. Allowing the user to do everything within the application. If not checked, the user will need to be granted individual permissions within SmartConnect.
Active	If checked, the user will be active. If not checked, the user will be inactive.
First Name	First Name given to the user.
Last Name	Last Name given to the user.
Create or Update Instances	Allows user to create or update connector instances.
Create or Update Data Sources	Allows user to create or update data sources.
Create or Update Integrations	Allows user to create or update integrations. The user will also need to be granted which specific integrations that they can create or update on the Integration Permissions tab. Also, the user will need to be granted which connector instances they have access to on the Connector Instance tab. If a user has access to an integration but doesn't have access to the connector used, then they will not be able to update that integration.
Run Integrations	Allows user to run integrations.
Schedule Integrations	Allows user to schedule Integrations.
Maintenance	Allows user to open and update SmartConnect Maintenance.
Import	Allows user to Import Integrations.
Export	Allows user to Export Integrations.
Legacy Web Service	Allows user to access the Legacy Web Service.
Legacy REST	Allows user to access the Legacy REST.

User Setup – Integration Permission

Select which integrations the user will have access to by clicking the checkbox. The user will need Create or Update Integrations permissions to be able to access the integrations. Depending on which data source and destination is used, the user will also need connector instance permissions to open the integration.

If the user is an Admin, then they will have access to every integration by default.

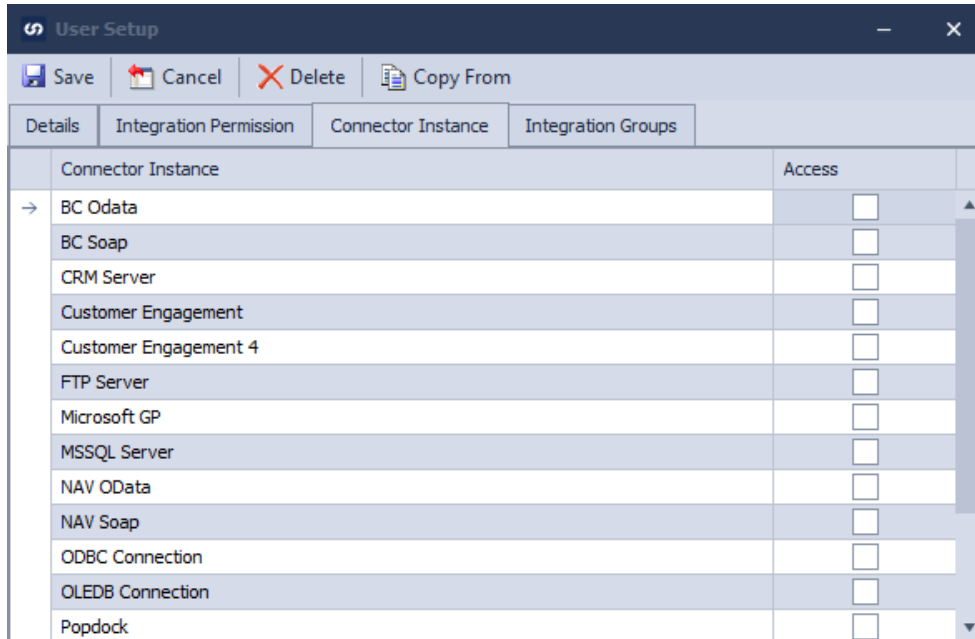

The screenshot shows the 'User Setup' dialog box with the 'Integration Permission' tab selected. The dialog has a title bar with a close button and a toolbar with 'Save', 'Cancel', 'Delete', and 'Copy From' buttons. Below the toolbar are four tabs: 'Details', 'Integration Permission', 'Connector Instance', and 'Integration Groups'. The 'Integration Permission' tab displays a table with two columns: 'Integration' and 'Access'. The table lists 13 integrations, each with an unchecked checkbox in the 'Access' column.

Integration	Access

User Setup – Connector Instance

Select what Connector Instances the user will have access to. If an integration has a BC OData destination, then the user will need to have access to the BC OData Connector Instance to open the integration. They will also need to have access to the integration on the Integration Permission tab and access to Create and Update integrations on the Details tab.

The screenshot shows the 'User Setup' dialog box with the 'Connector Instance' tab selected. The dialog has a title bar with a logo and window controls. Below the title bar is a toolbar with 'Save', 'Cancel', 'Delete', and 'Copy From' buttons. The main area contains a table with two columns: 'Connector Instance' and 'Access'. The table lists various connector instances, each with a corresponding checkbox in the 'Access' column. A right arrow is visible next to the first row, 'BC Odata'.

Connector Instance	Access
→ BC Odata	<input type="checkbox"/>
BC Soap	<input type="checkbox"/>

Refreshes the list of Users to show any changes made by other users since the window was opened.

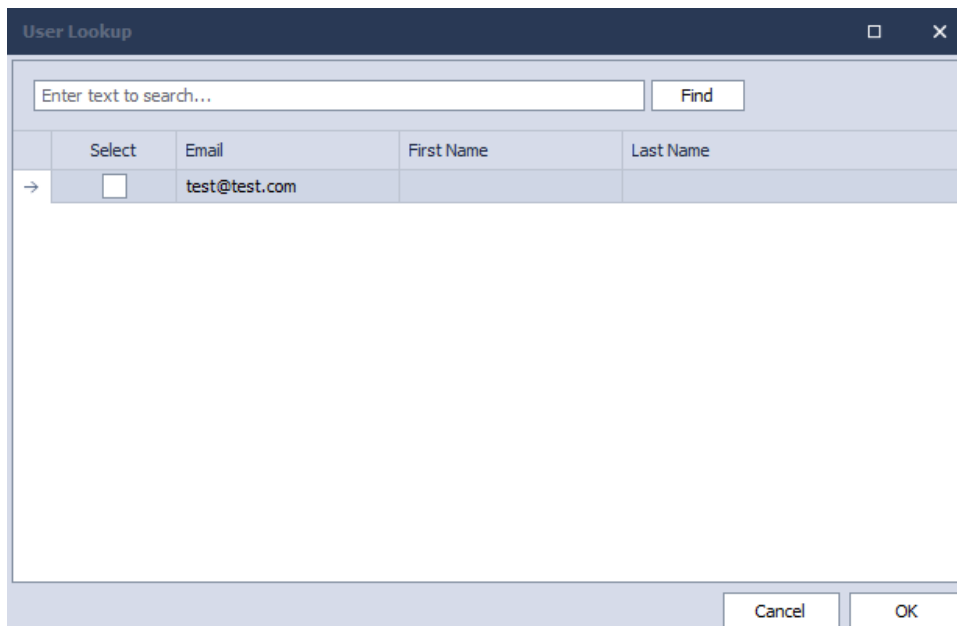

Security – Copy – To New User

Copies the setup of the selected User to a new User.

Security – Copy – To Existing Users

Copies the setup of the selected User to an existing User.

Select the existing User on the User Lookup window.

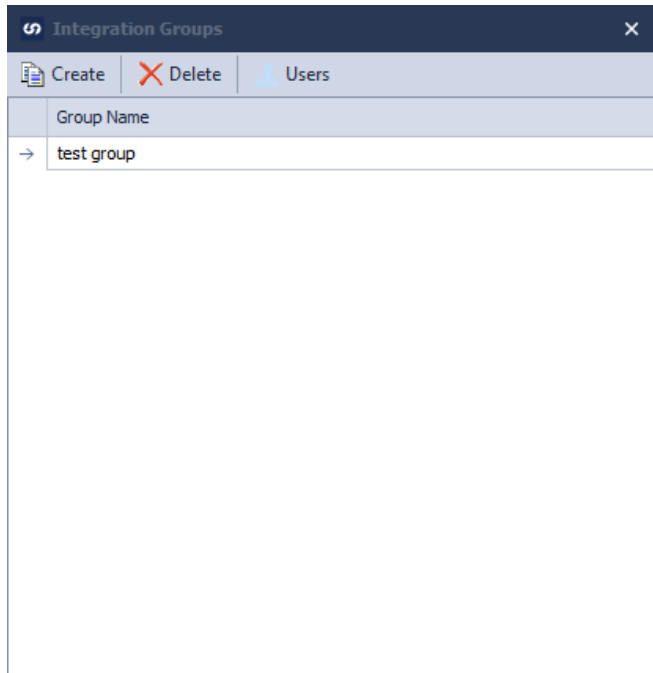

The screenshot shows a 'User Lookup' dialog box. It features a search bar at the top with the placeholder text 'Enter text to search...' and a 'Find' button. Below the search bar is a table with four columns: 'Select', 'Email', 'First Name', and 'Last Name'. The 'Select' column contains a checkbox, and the 'Email' column contains the text 'test@test.com'. To the left of the table is a right-pointing arrow. At the bottom of the dialog box are 'Cancel' and 'OK' buttons.

Select	Email	First Name	Last Name
<input type="checkbox"/>	test@test.com		

Security – Integration Group Security

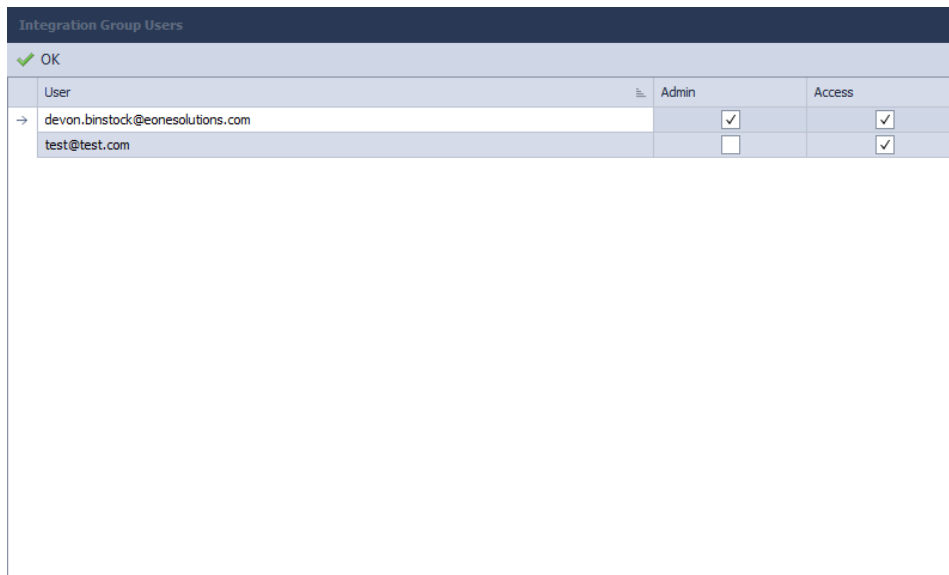

Integrations Groups can be created or deleted with this window.

The 'Integration Groups' window features a dark blue title bar with a logo and a close button. Below the title bar is a light blue bar with three tabs: 'Create' (with a document icon), 'Delete' (with a red 'X' icon), and 'Users' (with a person icon). The main area is a table with a header row labeled 'Group Name'. A single row is visible with the value 'test group' and a selection arrow to its left.

	Group Name
→	test group

The Users tab will display all the Users and if they have access to the selected Integration Group or not.

The 'Integration Group Users' window has a dark blue title bar. Below it is a light blue bar with a green checkmark and the text 'OK'. The main area is a table with three columns: 'User', 'Admin', and 'Access'. The 'User' column has a selection arrow to its left. Two rows are displayed: one for 'devon.binstock@eonesolutions.com' and one for 'test@test.com'. The 'Admin' column contains checkboxes, and the 'Access' column contains checkboxes.

	User	Admin	Access
→	devon.binstock@eonesolutions.com	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
	test@test.com	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Security – Web Security

WCF REST Service Security – Services

Each request available via the SmartConnect web service may be turned on/off in the configuration screen. To enable or disable a request through SmartConnect, and to enable SmartConnect security for web service requests:

1. Select or de-select the checkbox beside the required request to enable or disable the request.
2. Once a request has been enabled the type of security required for the request may be selected.
 - a. No Security: no extra security will be applied to the SmartConnect web service. Security defined in IIS and the web.config file will still be applied.
 - b. Standard Security: make the security for this request the standard SmartConnect webs service security. When this option is selected the 'Define Standard Security' button at the bottom of the screen should be configured. This defines what is meant by standard security. Note: Security defined in IIS and the web.config file will be applied over and above standard security.
 - c. Specify Security: specify a special security configuration for this request. When selected this option will enable a configuration button that will allow the configuration of security specific to the request.
3. Select OK to save your changes. Note: changes made to web service configurations via SmartConnect require the web service to be restarted before they will take effect.

The image shows a screenshot of the 'WCF REST Service Security' dialog box. The dialog has a title bar with a close button (X). Below the title bar are 'OK' and 'Cancel' buttons. There are three tabs: 'Services', 'Logging', and 'Security Logs'. The 'Services' tab is selected. Under the 'Enable Web Services' section, there is a list of services with checkboxes and dropdown menus for security settings. All checkboxes are checked, and all dropdown menus are set to 'Use Standard Security'. At the bottom right, there is a 'Define Standard Security' button with a lock icon.

Service	Security Setting
<input checked="" type="checkbox"/> Run Map	Use Standard Security
<input checked="" type="checkbox"/> Run Map With Data Table	Use Standard Security
<input checked="" type="checkbox"/> Run Map With Xml	Use Standard Security
<input checked="" type="checkbox"/> Run Map CRM Realtime	Use Standard Security
<input checked="" type="checkbox"/> Run Map Ms Gp Realtime	Use Standard Security
<input checked="" type="checkbox"/> Run Map Salesforce Realtime	Use Standard Security
<input checked="" type="checkbox"/> Run Map Mssql Realtime	Use Standard Security
<input checked="" type="checkbox"/> Get Maps	Use Standard Security
<input checked="" type="checkbox"/> Get Map Columns	Use Standard Security
<input checked="" type="checkbox"/> Get Data	Use Standard Security
<input checked="" type="checkbox"/> Save Process Errors	Use Standard Security

Define Standard Security

WCF REST Service Security – Logging

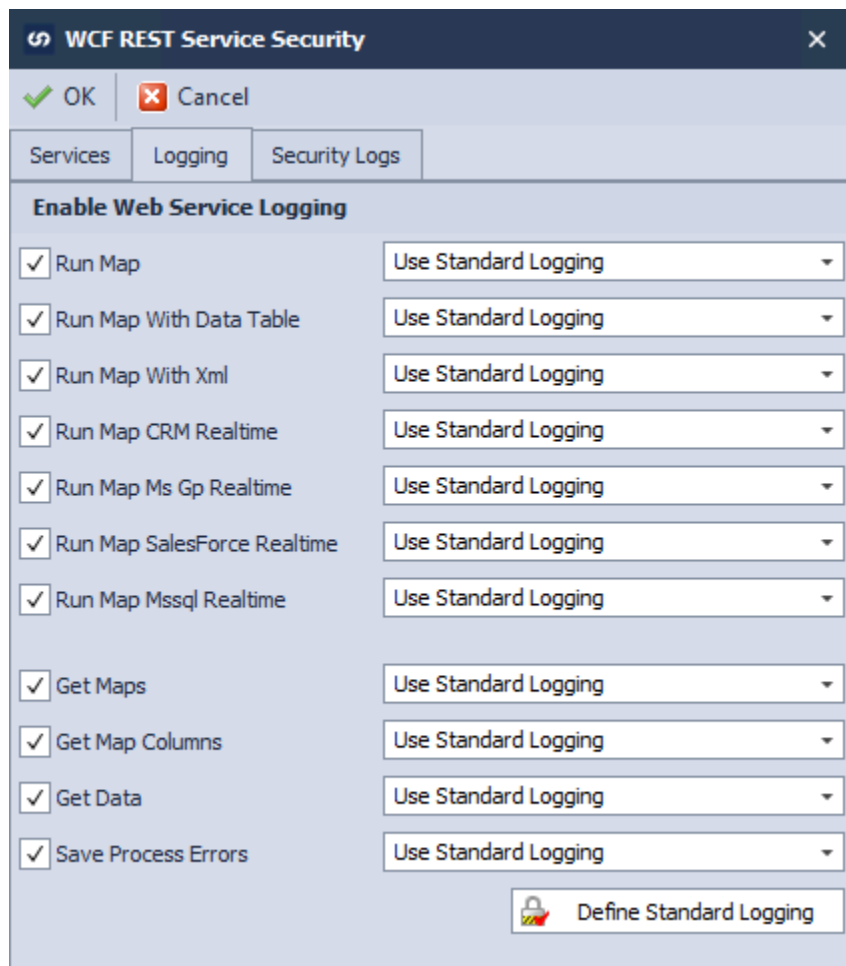

Requests made to the SmartConnect web service may be logged in the SmartConnect web service activity log.

Enable the SmartConnect web service activity log:

Logging may be set up standard across multiple requests or individually for specified requests.

To enable the activity log:

1. Select the checkbox beside the required request to enable logging for that request.
2. Select either 'Use Standard Logging' or 'Specify Logging' as required.
3. If standard logging is selected, select the Define Standard Logging button to set up logging. If Specify Logging is selected, select the configuration button to specify logging settings.
4. Enter the required settings on the logging setup screen.

The image shows a screenshot of the 'WCF REST Service Security' dialog box, specifically the 'Logging' tab. The dialog has a title bar with a close button (X) and a toolbar with 'OK' and 'Cancel' buttons. Below the toolbar are three tabs: 'Services', 'Logging' (selected), and 'Security Logs'. The main area is titled 'Enable Web Service Logging' and contains a list of web service requests, each with a checkbox and a dropdown menu for logging configuration. All checkboxes are checked, and all dropdowns are set to 'Use Standard Logging'. At the bottom right, there is a button labeled 'Define Standard Logging' with a small icon.

Request	Logging Configuration
<input checked="" type="checkbox"/> Run Map	Use Standard Logging
<input checked="" type="checkbox"/> Run Map With Data Table	Use Standard Logging
<input checked="" type="checkbox"/> Run Map With Xml	Use Standard Logging
<input checked="" type="checkbox"/> Run Map CRM Realtime	Use Standard Logging
<input checked="" type="checkbox"/> Run Map Ms Gp Realtime	Use Standard Logging
<input checked="" type="checkbox"/> Run Map Salesforce Realtime	Use Standard Logging
<input checked="" type="checkbox"/> Run Map Mssql Realtime	Use Standard Logging
<input checked="" type="checkbox"/> Get Maps	Use Standard Logging
<input checked="" type="checkbox"/> Get Map Columns	Use Standard Logging
<input checked="" type="checkbox"/> Get Data	Use Standard Logging
<input checked="" type="checkbox"/> Save Process Errors	Use Standard Logging

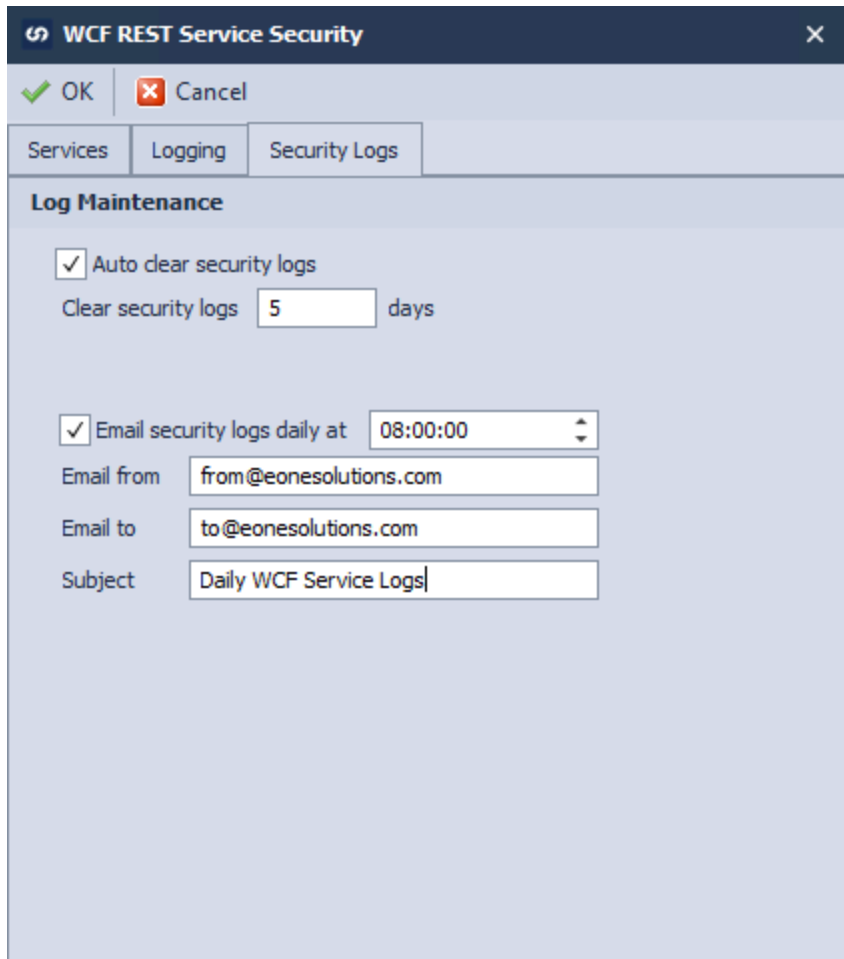

Define Standard Logging

WCF REST Service Security – Security Logs

If security logs should be automatically deleted after a specified time frame check the Auto clear security logs checkbox. Enter the number of days to keep security logs. Logs older than this will be removed.

You can also email the logs daily. Check the box to Email security logs daily. Set a time to send the email and the Email from, Email to, and Subject fields.

Note: the SmartConnect windows service must be running before automatic removal will occur.

The image shows a Windows-style configuration window titled "WCF REST Service Security". It has a dark blue header bar with a close button (X) on the right. Below the header is a light blue bar with "OK" (green checkmark) and "Cancel" (red X) buttons. The main area has three tabs: "Services", "Logging", and "Security Logs", with "Security Logs" being the active tab. Under the "Security Logs" tab, there is a section titled "Log Maintenance". It contains two checked checkboxes: "Auto clear security logs" and "Email security logs daily at". The "Auto clear security logs" checkbox is followed by a text input field containing "5" and the word "days". The "Email security logs daily at" checkbox is followed by a time selection dropdown menu showing "08:00:00". Below these are three text input fields: "Email from" with the value "from@eonesolutions.com", "Email to" with the value "to@eonesolutions.com", and "Subject" with the value "Daily WCF Service Logs".

WCF REST Service Security

OK Cancel

Services Logging Security Logs

Log Maintenance

☒ Auto clear security logs
Clear security logs 5 days

☒ Email security logs daily at 08:00:00

Email to to@eonesolutions.com

Subject Daily WCF Service Logs

About

Displays the active instance details.

The screenshot shows a software window titled "About" with a close button (X) in the top right corner. The window has a light blue background. At the top, the text "eOne SmartConnect" is displayed in a large, bold font. Below this, there is a table of instance details. The table has two columns: the first column contains labels for various attributes, and the second column contains their corresponding values. The attributes listed are SmartConnect Version, Account Code, Account Name, License Type, Registration Date, Expiry Date, and Connection Count. The values are 21.1.0.447, a masked account code, Two, Inc., Perpetual, 05/18/2021, 07/19/3000, and 50, respectively. At the bottom of the window, there is a copyright notice: "© 2007 eOne Integrated Business Solutions. All rights reserved."

SmartConnect Version:	21.1.0.447
Account Code:	[REDACTED]
Account Name:	Two, Inc.
License Type:	Perpetual
Registration Date:	05/18/2021
Expiry Date:	07/19/3000
Connection Count:	50
